Before you begin

Read and understand these instructions before performing any procedure using this drive.

DANGER

HAZARDOUS ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Read and understand the Installation Manual before installing or operating the ATV LIFT drive. Installation, adjustment, repair, and maintenance must be performed by qualified personnel.
- The user is responsible for compliance with all international and national electrical standards in force concerning protective grounding of all equipment.
- Many parts in this variable speed drive, including printed wiring boards, operate at line voltage. DO NOT TOUCH. Use only electrically insulated tools.
- DO NOT touch unshielded components or terminal strip screw connections with voltage present.
- DO NOT short across terminals PA/+ and PC/- or across the DC bus capacitors.
- Install and close all the covers before applying power or starting and stopping the drive.
- Before servicing the variable speed drive
 - Disconnect all power.
 - Place a "DO NOT TURN ON" label on the variable speed drive disconnect.
 - Lock the disconnect in the open position.
- Disconnect all power including external control power that may be present before servicing the drive. WAIT 15 MINUTES to allow the DC bus capacitors to discharge. Then follow the DC bus voltage measurement procedure given in the Installation Manual to verify that the DC voltage is less than 42 Vdc. The drive LEDs are not accurate indicators of the absence of DC bus voltage.

Failure to follow these instructions will result in death or serious injury.

CAUTION

DAMAGED EQUIPMENT

Do not operate or install any drive that appears damaged.

Failure to follow this instruction can result in injury and/or equipment damage.

Documentation structure

The following Altivar LIFT technical documents are available on www.schneider-electric.com

Installation manual

This describes how to assemble and connect the drive.

Programming Manual

This describes the functions, parameters and use of the drive terminal (integrated display terminal and graphic display terminal). The communication functions are not described in this manual, but in the manual for the bus or network used.

Communication parameters manual

This manual describes:

- The drive parameters with specific information for use via a bus or communication network.
- The operating modes specific to communication (state chart).
- The interaction between communication and local control.

Manuals for Modbus[®], CANopen[®], Ethernet[™], Profibus[®], INTERBUS, Uni-Telway and Modbus[®] Plus, etc.

These manuals describe the assembly, connection to the bus or network, signaling, diagnostics, and configuration of the communication-specific parameters via the integrated display terminal or the graphic display terminal. They also describe the communication services of the protocols.

Software enhancements

Since the Altivar LIFT was first launched, it has benefited from the addition of several new functions. The software version has been updated to V5.4.

Although this documentation relates to version V5.4, it can still be used with earlier versions.

Enhancements made to version V5.4 in comparison to V5.3

New parameters and functions

Menu [1.1 LIFT] (LIF-)

- New parameter [Preset speed selec] (PSEn) (see page [42](#))
- New parameter [Stop type ISP] (SttL) (see page [97](#))
- New parameter [Delay Thermal fault] (dth) (see page [106](#))
- New parameter [International unit] (SIU) page [119](#)
- New parameters for the rescue mode : (see page [101](#))
 - [Opt. rescue mode] (OrM): Optimized rescue mode.
 - [Acc. time rescue] (rACC): Acceleration time during rescue.
 - [Resc max current] (rCLI): Current limitation during rescue.
 - [Calc. rescue power] (PMC): This is the power needed by the drive only during evacuation.
 - [Cust. rescue speed] (OrSP): Maximum optimized rescue speed,
- New methods of assigning logic output (see page [43](#) [OUTPUTS] (OUT-))
 - [Rescue dir.] (Opt): Optimized direction for rescue mode.
 - [Rdy to run] (rdYr): The drive is ready to start or already started.
- New methods of assigning [Encoder usage] (EnU)
 - [Slip Comp.] (CO): The encoder provides speed feedback for speed correction and monitoring. (see page [46](#))
- New methods of assigning [Thermal alarm stop] (SA) (see page [106](#))
 - [No] (nO): Function inactive
 - [Th. mot drv] (tH): Deferred stop on drive thermal alarm or motor thermal alarm
 - [PTC] (PtC): Deferred stop on PTC alarm
 - [ALL] (ALL): Deferred stop on drive thermal alarm, motor thermal alarm or PTC alarm
- New factory setting for [Dis. operat opt code] (dOtd) (see page [137](#))
 - [Freewheel] (nSt) to [Ramp stop] (rMp)

Menu [1.7 APPLICATION FUNCT.] (FUN-)

- New parameter [Stop type ISP] (SttL). (see page [264](#))
- New parameters for the rescue mode: (see page [265](#))
 - [Opt. rescue mode] (OrM): Optimized rescue mode.
 - [Acc. time rescue] (rACC): Acceleration time during rescue.
 - [Resc max current] (rCLI): Current limitation during rescue.
 - [Calc. rescue power] (PMC): This is the power needed by the drive only during evacuation.
 - [Cust. rescue speed] (OrSP): Maximum optimized rescue speed,
- New parameter [Delay Thermal fault] (dth) (see page [278](#))

Presentation

ATV LIFT has been specially developed for lift applications and therefore meets the requirements of lift installers:

- Quick, simple drive setup via a dedicated LIFT menu.
- Drive performance that offers optimum comfort.
- Integrated LIFT functions: special lift ramp, inspection function, rollback management, optimization of "half floors", UPS evacuation, etc.

ATV LIFT can only be used with lifts.

⚠ WARNING
LOSS OF CONTROL
The speed loop implemented in the ATV LIFT is specifically adapted to lift applications. It must only be used in a lift application.
Failure to follow these instructions can result in injury and/or equipment damage.

The following options are compatibles with ATV LIFT from a minimum version:

- graphic display terminal from the version V1.1IE24,
- universal encoder interface card (VW3A3409) from the version V1.2IE01.

ATV LIFT selection has been simplified: the sizing of the ATV LIFT is done with the nominal current of the motor. This new policy adapts ATV LIFT references with synchronous motors. Maximum transient current has changed. It was 1.5 In with ATV71L and is now 1.36 In with ATV LIFT.

When migrating a lift application from ATV71L to ATV LIFT, you have to check that the drive does not reach **[current Limitation] (CLI)** state during acceleration or deceleration.

In case of current limitation, adapt the drive parameters if necessary:

- Increase **[Acceleration time] (ACt)**
- Decrease **[Lift Leveling time] (LLt)**

To improve the comfort in the lift, you have also the possibility to use the notch filter function.

- The previous ATV71L references not listed are no longer available. You have to take the higher power rating drive for substitution.
- Commercial reference construction: ATV71LD $xxyy$ Z where:
 - xx : Maximum continuous current at 380 Vac for N4 products and 230 Vac for M3 products.
 - yy : Three phase supply voltage M3 = 230V & N4 = 380V.

Power Rating	Current Rating	Catalog part number		Mechanical Size	
		ATV71L	ATV LIFT	ATV71L	ATV LIFT
3-phase supply voltage : 200...240V					
5,5kW	27A	ATV71LU55M3Z	ATV71LD27M3Z	175*295*161	230*400*187
7,5kW	33A	ATV71LU75M3Z	ATV71LD33M3Z	210*295*187	230*400*187
11kW	54A	ATV71LD11M3XZ	ATV71LD54M3Z	230*400*187	240*420*210
15kW	66A	ATV71LD15M3XZ	ATV71LD66M3Z	230*400*187	240*420*210
3-phase supply voltage : 380...480V					
4kW	10A	ATV71LU40N4Z	ATV71LD10N4Z	155*260*161	175*295*161
5,5kW	14A	ATV71LU55N4Z	ATV71LD14N4Z	175*295*161	175*295*161
7,5kW	17A	ATV71LU75N4Z	ATV71LD17N4Z	175*295*161	210*295*187
11kW	27A	ATV71LD11N4Z	ATV71LD27N4Z	210*295*187	230*400*187
15kW	33A	ATV71LD15N4Z	ATV71LD33N4Z	230*400*187	230*400*187
22kW	48A	ATV71LD22N4Z	ATV71LD48N4Z	240*420*210	240*550*230

Note: the transfer from the graphic display terminal to the drive is possible from ATV71L to ATV LIFT.

The transfer from ATV LIFT to ATV71 L is not possible.

See [\[3 OPEN/SAVE AS\]](#) page [304](#) for a complete description of configuration transfer.

Standard EN81-1 certification

EUROPEAN STANDARD EN 81-1 (Ref. No. EN 81-1:1998 E)

The ATV LIFT drive is now compliant with European Standard EN81-1 12.7.3 b) 2) and 3)

12 Lift machine

12.7 Stopping the machine and checking its stopped condition

12.7.3 A.C. or D.C. motor supplied and controlled by static elements

b) a system consisting of :

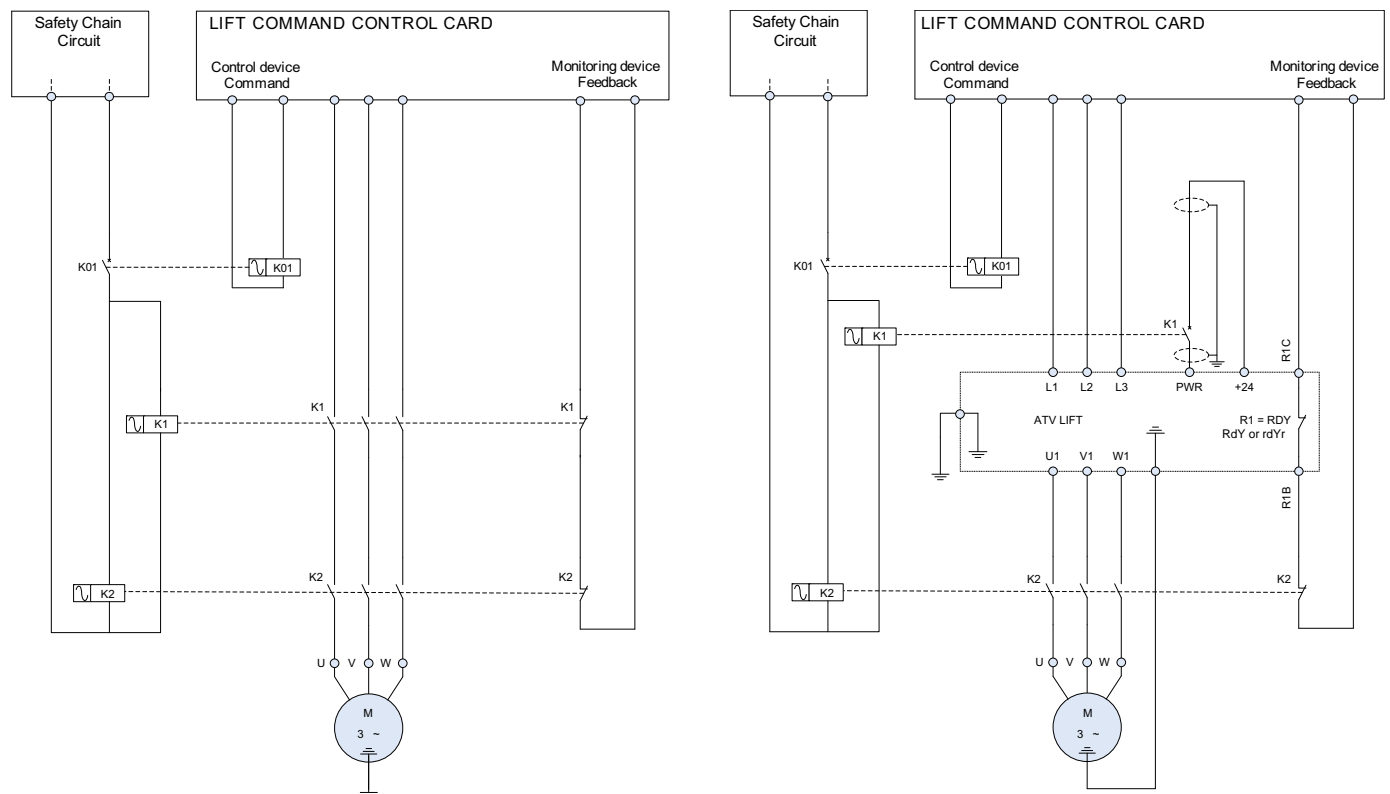

1) a contactor interrupting the current at all poles.

The coil of the contactor shall be released at least before each change in direction. If the contactor does not release, any further movement of the lift shall be prevented, and

2) a control device blocking the flow of energy in the static elements, and

3) a monitoring device to verify the blocking of the flow of energy each time the lift is stationary.

If, during a normal stopping period, the blocking of the flow of energy by the static elements is not effective, the monitoring device shall cause the contactor to release and any further movement of the lift shall be prevented.

The ATV LIFT is in place of the power contactor K1.

- The contactor interrupting the current at all poles is K2
- The control device blocking the flow of energy in the static elements is the drive ATV LIFT through Power Removal safety function input
- The monitoring device to verify the blocking of the flow of energy each time the lift is stationary is the output drive relay R1 and the auxiliary contact of K2 contactor.

Vocabulary

Lift command

Electronic card integrating the lift application intelligence: call management, step displays.
The lift command card monitors the slowdown and stop indicators and controls the drive.

Slowdown indicator

Sensor placed at a precise distance (slowdown length) above and below each step.
When the car passes in front of this sensor, the lift command card removes the high speed command (travel speed) and commands a low speed (lift leveling speed).

Stop indicator

Sensor placed at a precise distance (stop length) above and below each step.
When the car passes in front of this sensor, the lift command card removes the run command. The car should then stop comfortably within the [Stop length] (StL).

Rollback

Movement of the car when the brake is released. In gearless applications where the inertia at the motor is large, the brake release must be specially controlled to cancel this rollback (using an external weight sensor or the rollback management function).

Jerk

Jerk is a measurement of variations in acceleration. It is often related to comfort (comfort is improved as the jerk is reduced).

INSTALLATION

- **1 Consult the Installation Manual**

PROGRAMMING

Procedure applicable if the factory configuration, page [11](#), and use of the [\[1.1 LIFT\] \(LIF-\)](#) menu only are sufficient for the application.

Tips:

- Before you start programming, complete the user setting tables, page [325](#).
- Perform an auto-tuning operation to optimize performance, page [54](#).
- If you get lost, return to the factory settings, page [301](#).

Note: Check that the wiring of the drive is compatible with its configuration.

■ **2 Power up without run command**

- If you are using a separate control power supply, follow the instructions on page [12](#).

■ **3 Select the language, if the drive has a graphic display terminal**

■ **4 Configure the menu** **[1.1 LIFT] (L I F -)**

■ **5 Start**

Factory configuration

Drive factory settings

The Altivar LIFT is factory-set for the most common operating conditions:

- **Motor** frequency: 50 Hz
- Normal stop mode on deceleration lift ramp
- Stop mode in the event of a trip: Freewheel
- Deceleration ramp with leveling speed step.
- Motor thermal current = rated drive current
- Standstill injection braking current = 0.7 x rated drive current, for 0.5 seconds
- No automatic starts after a trip
- Switching frequency 8 kHz.
- Logic inputs:
 - LI1: forward, LI2: reverse (2 operating directions), 2-wire control on transition
 - LI3: Inactive (not assigned)
 - LI4: Lift speed
 - LI5: Inspection mode
 - LI6: Not assigned
- Analog inputs:
 - AI1: Speed reference 0 +10 V
 - AI2: 0-20 mA, inactive (not assigned)
- Relay R1: no
- Relay R2: Brake control
- Analog output AO1: dO1 (logic output)

If the above values are compatible with the application, the drive can be used without changing the settings.

Option card factory settings

The option card inputs/outputs are not factory-set.

Setup - Preliminary recommendations

Turning on and configuring the drive

 DANGER
UNINTENDED EQUIPMENT OPERATION <ul style="list-style-type: none">• Before turning on and configuring the Altivar LIFT, check that the PWR (POWER REMOVAL) input is deactivated (at state 0) in order to prevent unintended operation.• Before turning on the drive, or when exiting the configuration menus, check that the inputs assigned to the run command are deactivated (at state 0) since they can cause the motor to start immediately. <p>Failure to follow these instructions will result in death or serious injury.</p>

 CAUTION
INCOMPATIBLE LINE VOLTAGE <p>Before turning on and configuring the drive, ensure that the line voltage is compatible with the supply voltage range shown on the drive nameplate. The drive may be damaged if the line voltage is not compatible.</p> <p>Failure to follow these instructions can result in equipment damage.</p>

Separate control section power supply

When the drive control section is powered independently of the power section (P24 and 0V terminals), whenever an option card is added or replaced, only the power section must be supplied with power next time the drive is powered up. By default the new card would not be recognized and it would be impossible to configure it, thereby causing the drive to lock in fault mode.

Power switching via line contactor

 CAUTION
<ul style="list-style-type: none">• Avoid operating the contactor frequently (premature ageing of the filter capacitors).• Cycle times < 60 s can result in damage to the precharge resistor. <p>Failure to follow these instructions can result in equipment damage.</p>

User adjustment and extension of functions

- The display unit and buttons can be used to modify the settings and to extend the functions described in the following pages.
- **Return to factory settings** is made easy by the [\[1.12 FACTORY SETTINGS\] \(FCS-\)](#) menu, see page [299](#).
- There are three types of parameter:
 - Display: Values displayed by the drive
 - Adjustment: Can be changed during operation or when stopped
 - Configuration: Can only be modified when stopped and no braking is taking place. Can be displayed during operation.

 DANGER
UNINTENDED EQUIPMENT OPERATION <ul style="list-style-type: none">• Check that changes made to the settings during operation do not present any danger.• We recommend stopping the drive before making any changes. <p>Failure to follow these instructions will result in death or serious injury.</p>

Setup - Preliminary recommendations

Starting

Important:

- In factory settings mode, the motor can only be supplied with power once the “forward”, “reverse” and “DC injection stop” commands have been reset:
 - On power-up or a manual detected fault reset or after a stop command. If they have not been reset, the drive will display "nSt" but will not start.
- If the automatic restart function has been configured ([Automatic restart] (Atr) parameter in the [1.8-FAULT MANAGEMENT] (FLt-) menu, see page 273), these commands are taken into account without a reset being necessary.

Test on a low power motor or without a motor

- In factory settings mode, [Output Phase Loss] (OPL) detection page 276 is active (OPL = YES). To check the drive in a test or maintenance environment without having to switch to a motor with the same rating as the drive (particularly useful in the case of high power drives), deactivate [Output Phase Loss] (OPL = nO).

CAUTION

RISK OF DAMAGE TO THE EQUIPMENT

Motor thermal protection will not be provided by the drive if the motor current is less than 0.2 times the rated drive current. Provide an alternative means of thermal protection.

Failure to follow these instructions can result in equipment damage.

Use of the LIFT menu

WARNING

LOSS OF CONTROL

- Identify the precise values of [Nominal car speed] (CSP) and payload [Capacity of the lift] (LCA).
- Check the [Nominal car speed] (CSP) by calculation (See menu [1.1 LIFT] (LIF-), submenu [LIFT DATA] (LdA-)) or by measurement.

If the values of [Nominal car speed] (CSP) or [Lift capacity] (LCA) are incorrect, the stop lengths ([Deceleration length] (dEL) and [Stop length] (StL) will not be adhered to.

The speed loop preset will not be adapted to the application (risk of instability and lift car slipping).

Failure to follow these instructions will result in death or serious injury.

Graphic terminal

The graphic terminal is optional. The graphic terminal is removable and can be located remotely (on the door of an enclosure, for example) using the cables and accessories available as options (see catalog).

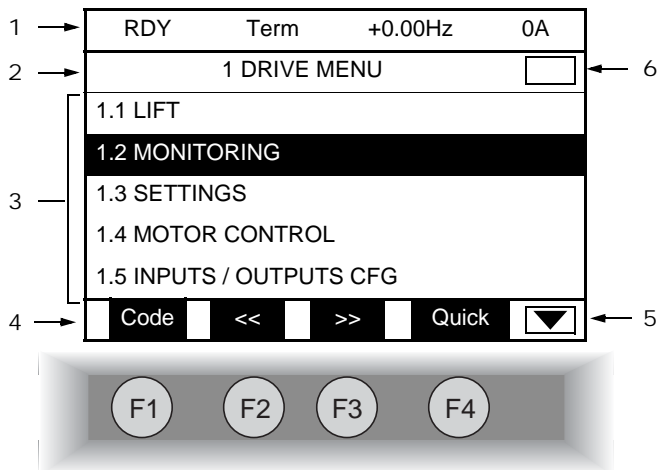

Description of the terminal

Note: Buttons 3, 4, 5 and 6 can be used to control the drive directly, if control via the display terminal is activated.

Graphic terminal

Description of the graphic screen

1. Display line. Its content can be configured; the factory settings show:

- The drive state (see page [16](#))
- The active control channel:
 - Term: Terminals
 - HMI: Graphic terminal
 - MDB: Integrated Modbus
 - CAN: Integrated CANopen
 - NET: Communication card
 - APP: Controller Inside card
- Frequency reference
- Current in the motor

2. Menu line. Indicates the name of the current menu or submenu.

3. Menus, submenus, parameters, values, bar charts, etc., are displayed in drop-down window format on a maximum of 5 lines. The line or value selected by the navigation button is displayed in reverse video.

4. Section displaying the functions assigned to the F1 to F4 keys and aligned with them, for example:

- Code **F1** : Displays the code of the selected parameter, i.e., the code corresponding to the 7-segment display.
- HELP **F1** : Contextual help
- << **F2** : Navigate horizontally to the left, or go to previous menu/submenu or, for a value, go to the next digit up, displayed in reverse video (see the example on page [17](#)).
- >> **F3** : Navigate horizontally to the right or go to next menu/submenu (going to the [2 ACCESS LEVEL] menu in this example) or, for a value, go to the next digit down, displayed in reverse video (see the example on page [17](#)).
- Quick **F4** : Quick navigation, see page [21](#).

The function keys are dynamic and contextual.

Other functions (application functions) can be assigned to these keys via the [1.6 COMMAND] menu.

5. Indicates that there are no more levels below this display window.
 Indicates that there are more levels below this display window.
6. Indicates that this display window does not scroll further up.
 Indicates that there are more levels above this display window.

Drive state codes:

- ACC: Acceleration
- CLI: Current limitation
- CTL: Controlled stop on input phase loss
- DCB: DC injection braking in progress
- DEC: Deceleration
- FLU: Motor fluxing in progress
- FST: Fast stop
- NLP: No line power (no line supply on L1, L2, L3)
- NST: Freewheel stop
- OBR: Auto-adapted deceleration
- PRA: Power Removal function active (drive locked)
- RDY: Drive ready
- RUN: Drive running
- SOC: Controlled output cut in progress
- TUN: Auto-tuning in progress
- USA: Undervoltage alarm
- ASA: Measurement of the phase-shift angle in progress

Graphic terminal

Example configuration windows:

[1.7 APPLICATION FUNCT.] :	Configuration of application functions (e.g., preset speeds, PID, brake control, etc.)
[1.8 FAULT MANAGEMENT]:	Configuration of fault management
[1.9 COMMUNICATION]:	Communication parameters (fieldbus)
[1.10 DIAGNOSTICS]:	Motor/drive diagnostics
[1.11 IDENTIFICATION]:	Identifies the drive and internal options
[1.12 FACTORY SETTINGS]:	Access to configuration files and return to factory settings
[1.13 USER MENU]:	Specific menu set up by the user in the [7. DISPLAY CONFIG.] menu
[1.14 CONTROL. INSIDE CARD]:	Configuration of optional Controller Inside card

Integrated display terminal

Altivar LIFT features an integrated display terminal with a 7-segment 4-digit display. The graphic display terminal described on the previous pages can also be connected to this drive as an option.

Functions of the display and the keys

Note: • Pressing ▲ or ▼ does not store the selection.

• Press and hold down (>2 s) ▲ or ▼ to scroll through the data quickly.

Save and store the selection: ENT

The display flashes when a value is stored.

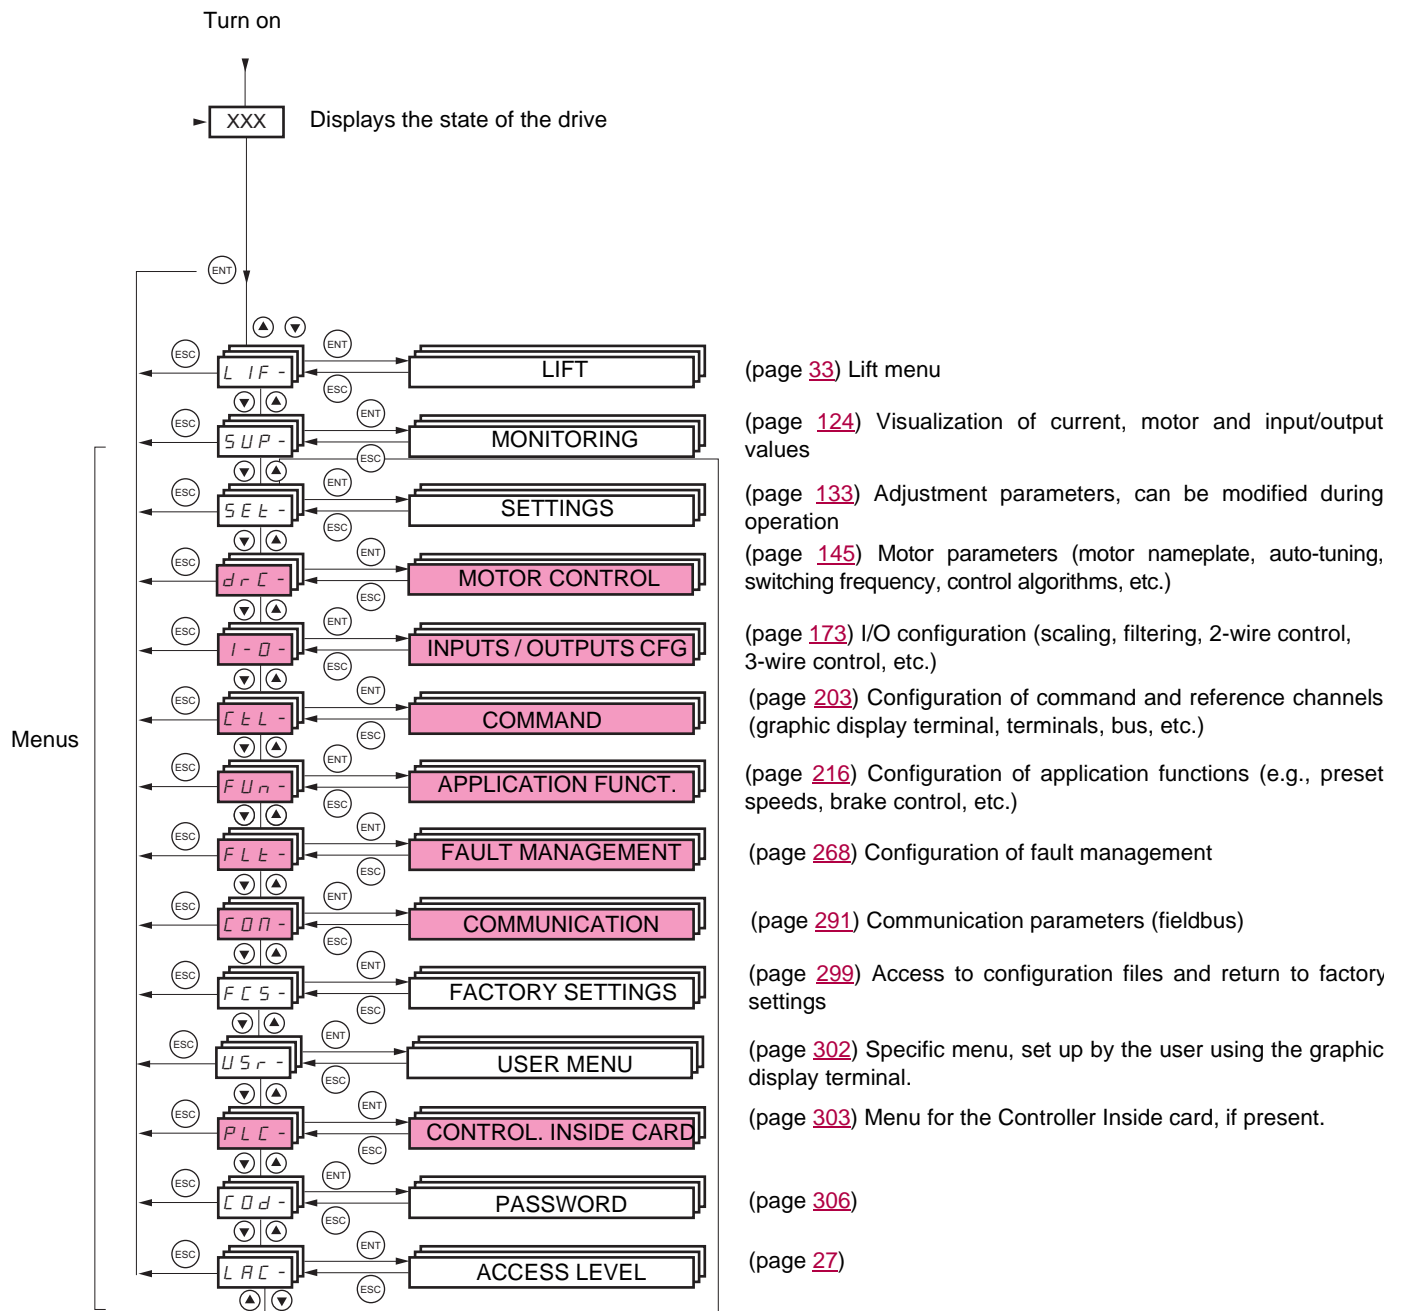

Normal display, with no detected fault present and no startup:

- 43.0: Display of the parameter selected in the SUP menu (default selection: Lift speed).
- CL: Current limitation.
- CtL: Controlled stop on input phase loss.
- dCb: DC injection braking in progress.
- FLU: Motor fluxing in progress.
- FSt: Fast stop.
- nLP: No line power (no line supply on L1, L2, L3).
- nSt: Freewheel stop.
- Obr: Auto-adapted deceleration.
- PrA: Power Removal function active (drive locked).
- rdY: Drive ready.
- SOC: Controlled output cut in progress.
- tUn: Auto-tuning in progress.
- USA: Undervoltage alarm.
- ASA: Measurement of the phase-shift angle in progress.

The display flashes to indicate the presence of a detected fault.

Integrated display terminal

Accessing menus

A dash appears after menu and submenu codes to differentiate them from parameter codes.

Examples: FUn- menu, ACC parameter.

 The grayed-out menus may not be accessible depending on the control access (LAC) configuration.

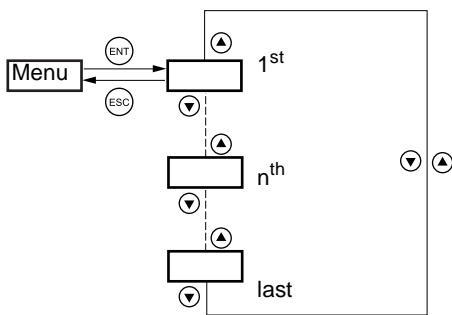

Integrated display terminal

Accessing menu parameters

Save and store the displayed selection: **ENT**

The display flashes when a value is stored.

All the menus are "drop-down" type menus, which means that after the last parameter, if you continue to press ▼, you will return to the first parameter and, conversely, you can switch from the first parameter to the last parameter by pressing ▲.

Selection of multiple assignments for one parameter

E.g. List of group 1 alarms in **[INPUTS / OUTPUTS CFG] (I-O-)** menu

A number of alarms can be selected by "checking" them as follows.

The digit on the right indicates:  selected,
 not selected.

The same principle is used for all multiple selections.

[2. ACCESS LEVEL] (LAC-)

With graphic display terminal

Basic

Access to 5 menus only, and access to 6 submenus only in the [1. DRIVE MENU] menu.

A single function can be assigned to each input.

(1) Can be accessed if the Controller Inside card is present.

Structure of the parameter tables

The parameter tables in the descriptions of the various menus can be used with both the graphic display terminal and the integrated display terminal. They therefore contain information for these two terminals in accordance with the description below.

E.g.

1. Name of menu on 4-digit 7-segment display.
2. Submenu code on 4-digit 7-segment display.
3. Parameter code on 4-digit 7-segment display.
4. Parameter value on 4-digit 7-segment display.
5. Name of menu on graphic display terminal.
6. Name of submenu on graphic display terminal.
7. Name of parameter on graphic display terminal
8. Value of parameter on graphic display terminal

Note:

- The text in square brackets [] indicates what you will see on the graphic display terminal.

Interdependence of parameter values

The configuration of certain parameters modifies the adjustment range of other parameters. **This may result in the modification of a factory setting or a value you have already selected.**

Finding a parameter in this document

The following assistance with finding explanations on a parameter is provided:

- **With the integrated display terminal:** Direct use of the parameter code index, page [328](#), to find the page giving details of the displayed parameter.
- **With the graphic display terminal:** Select the required parameter and press **F1** : [Code]. The parameter code is displayed instead of its name while the key is held down.

Example: ACC

RDY	Term	+0.00Hz	0A
1.3 SETTINGS			
Ramp increment:			01
Acceleration		9.51 s	
Deceleration:		9.67 s	
Acceleration 2:		12.58 s	
Deceleration 2:		13.45 s	
Code	<<	>>	Quick

Code
→

RDY	Term	+0.00Hz	0A
1.3 SETTINGS			
Ramp increment:			01
ACC		9.51 s	
Deceleration:		9.67 s	
Acceleration 2:		12.58 s	
Deceleration 2:		13.45 s	
Code	<<	>>	Quick

Then use the parameter code index, page [328](#), to find the page giving details of the displayed parameter.

[1.1 LIFT] (LIF-)

With graphic display terminal:

With integrated display terminal:

The [1.1 LIFT] (LIF-) menu is used to apply settings for a lift application.

Note: The parameters of the [1.1 LIFT] (LIF-) menu must be entered in the order in which they appear, as the later ones are dependent on the first ones.

The [1.1 LIFT] (LIF-) menu should be configured **on its own or before the other drive configuration menus**. If a modification has previously been made to any of them, in particular in [1.4 MOTOR CONTROL] (drC-), some [1.1 LIFT] (LIF-) parameters may be changed, for example, the motor parameters if a synchronous motor has been selected. Returning to the [1.1 LIFT] (LIF-) menu after modifying another drive configuration menu **is unnecessary**. Changes following modification of another configuration menu **are not therefore described**, to avoid unnecessary complication in this section.

[1.1 LIFT] (LIF-)

Lift configuration

To get started quickly on the ATV LIFT, follow the instructions below.

The LIFT menu has been designed to be browsed in a linear manner. Go through this menu step by step in order to enter all the parameters required for correct lift configuration.

Before starting to program the drive, identify the data below carefully:

Code	Name/Description	Value
[I/O ASSIGNMENTS] (LIO-)	<i>I/O menu</i>	
	L11 assignment L12 assignment L13 assignment L14 assignment L15 assignment L16 assignment A11 assignment A12 assignment R1 assignment R2 assignment
[ENCODER DATA] (End-)	<i>Encoder Data menu</i>	
[Number of pulses] (PGI)	Incremental encoder Number of pulses
[Freq.Excit.Resolve] (FrS) [Resolver poles nbr] (rppn)	Resolver encoder Resolver Excit Freq. Resolver poles nbr
[Encoder supply volt.] (UECU) [Sincos lines count] (UELC)	SinCos encoder Encoder supply volt. Number of lines
[Encoder supply volt.] (UECU) [Sincos lines count] (UELC)	Dual SinCos encoder Encoder supply volt. Number of lines
[Sincos lines count] (UELC)	EnDat SinCos encoder Sincos lines count
[MOTOR DATA] (Mot-)	<i>Motor Data menu</i>	
[Motor control type] (Ctt)	Motor control type SVC V, SVC I, V/F 2pts, V/F 5pts, Sync. mot, Sync. CL
[Rated motor power] (nPr) [Rated motor volt.] (UnS) [Rated mot. current] (nCr) [Rated motor freq.] (FrS) [Rated motor speed] (nSP)	Asynchronous Rated motor power Rated motor volt. Rated mot. current Rated motor freq. Rated motor speed kW V A Hz rpm

[LIFT DATA] (LdA-)	<i>Lift Data menu</i>	
[Nominal car speed] (CSP) [Capacity of the lift] (LCA) [Lift top speed] (LTS) [Deceleration length] (dEL) [Lift leveling time] (LLt) [Stop length] (StL) [Lift leveling speed] (LLS)	Nominal car speed at FRS Payload Travel speed Deceleration length Lift leveling time Stop length Lift leveling speed m/s kg m/s cm s cm m/s

Assignment of the inputs/outputs

The ATV LIFT is factory-set with the following I/O assignments:

Logic inputs

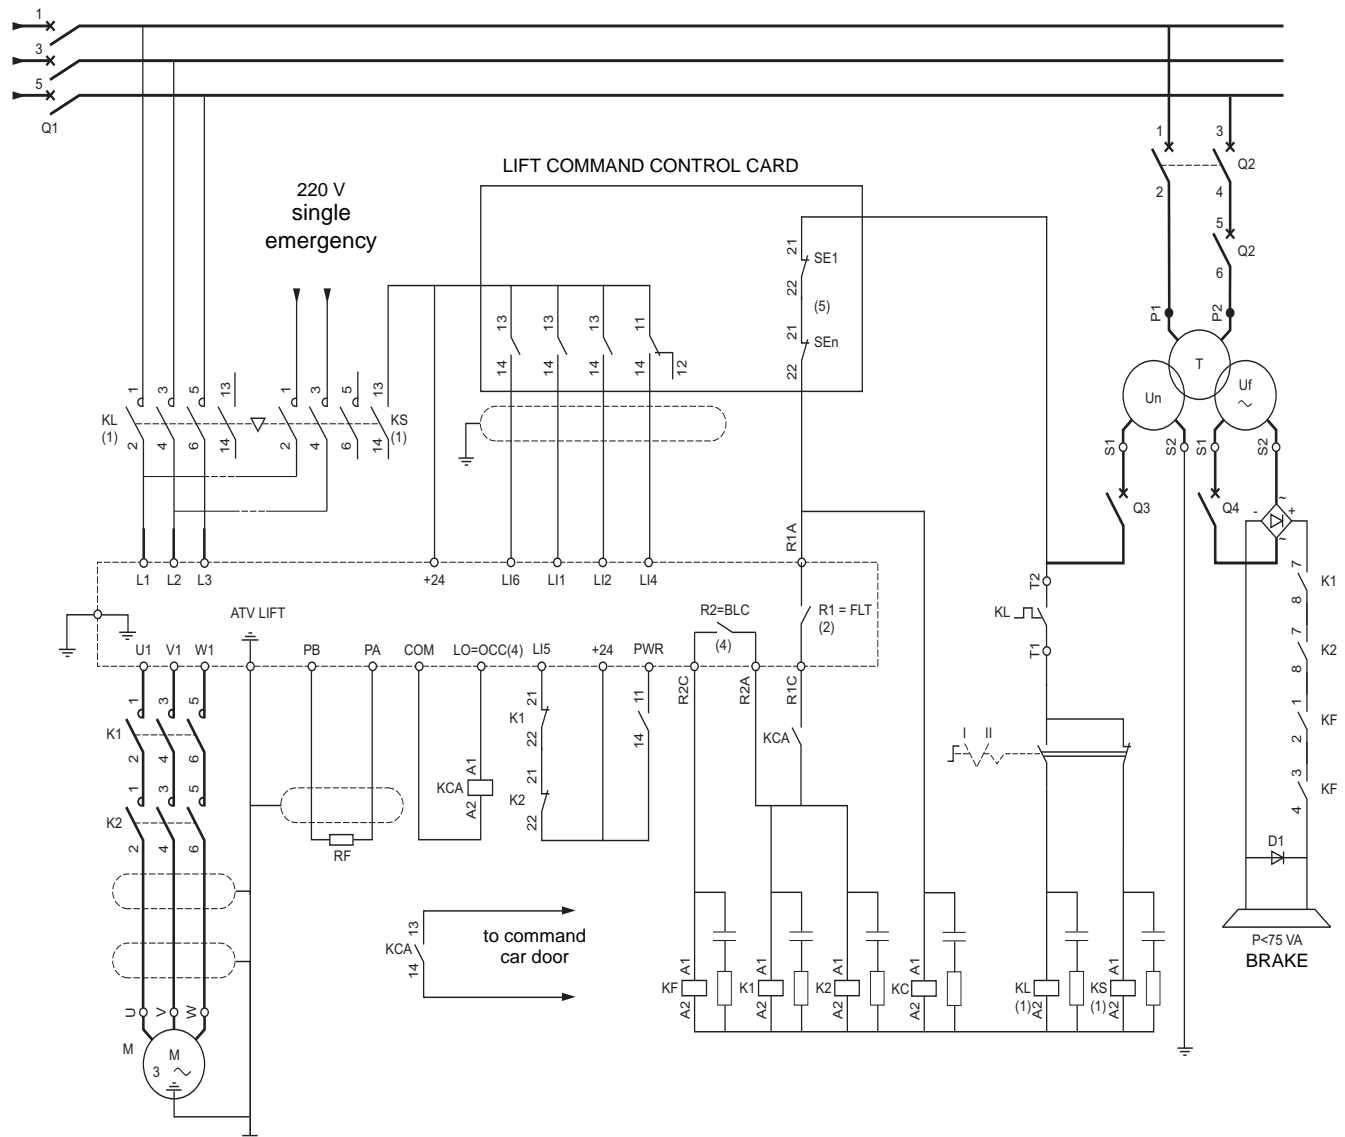

- LI1: Forward
- LI2: Reverse
- LI3: Not assigned
- LI4: Lift speed management
- LI5: Inspection mode
- LI6: Not assigned

Logic outputs

- R1: No
- R2: Brake sequence
- dO1: Output contactor

Analog inputs

- AI1: Channel reference

(1) Optional elements.

(2) Fault relay contacts for remote signalling of drive status (reassignable).

(3) Internal +24 V. If an external +24V supply is used, connect the 0 V on the external supply to the COM terminal, do not use the +24 terminal on the drive, and connect the common of the LI inputs to the +24 V of the external supply.

(4) Assignable relay R2 and logic output LO.

(5) Safety circuit.

[1.1 LIFT] (LIF-)

Speed selector and lift ramp (continued)

(PSEn) [Preset speed selec] allows to use up to 16 preset speeds (see page 112).

The preset speed reference will be taken into account as soon as the motor is stopped.
After using preset speed function, [LTS selection] (LtSS) or [LLS selection] (LLSS) could be enabled as soon as the motor is stopped.

When the preset speed reference is taken into account, the specific lift ramp is no longer activated and the drive follow the standard ramps.

[1.1 LIFT] (LIF-)

Lift data

Identification of the [Nominal car speed] (CSP) and payload [Capacity of the lift] (LCA)

For the nominal motor frequency [Rated motor freq.] (FrS) / [Nominal freq sync.] (FrSS) the car speed is [Nominal car speed] (CSP) = m/s.

Ratio 1:1

$$\text{CSP [m/s]} = 3.14 \times \text{Sheave radius [meters]} \times \text{NSP(S) [rpm]} / (60 \times \text{Gearbox radius})$$

Ratio 1:2

$$\text{CSP [m/s]} = 1.57 \times \text{Sheave radius [meters]} \times \text{NSP(S) [rpm]} / (60 \times \text{Gearbox radius})$$

Ratio 1:1

The car movement is equal to the length of cable unwound by the motor.

Ratio 1:2

The car movement is equal to half the length of cable unwound by the motor.

[1.1 LIFT] (LIF-)

Parameters management

Regarding the parameters that define the ramp profile, 2 kinds of parameters can be defined:

- Parameters for the application description: [Acceleration time] (ACt), [Lift top speed] (LtS), [Deceleration length] (dEL), [Stop length] (StL), [Lift leveling time] (LLt), [Lift leveling speed] (LLS), [Comfort accel.] (ACM) page 60, 61 and 57.
- Parameters for optimization : [Jerk round 1] (JAr1), [Jerk round 2] (JAr2), [Jerk round 3] (JAr3), [Jerk round 4] (JAr4), [Jerk round 5] (JAr5), [Jerk round 6] (JAr6) page 62.

When the application parameters are the same, the same default (that is to say without optimization settings) behaviour must be provided by the drive.

In the following drawings, identical colours indicates identical value and behaviour.

Once the application description parameters are set, an optimization phase can start.

 **Nota:** The adjustment of optimization parameters and [Comfort accel.] (ACM) parameter can modify parameters for application description in order to stay consistent with the optimization required.

Following interaction can eventually occur:

- The modification of [Jerk round 1] (JAr1) and [Jerk round 2] (JAr2) parameters can update [Acceleration time] (ACt).
- The modification of [Jerk round 3] (JAr3) and [Jerk round 4] (JAr4) parameters can update [Lift leveling speed] (LLS) and / or [Lift leveling time] (LLt).
- The modification of [Jerk round 5] (JAr5) and [Jerk round 6] (JAr6) parameters can update [Lift leveling speed] (LLS) and / or [Lift leveling time] (LLt).
- The modification of [Comfort accel.] (ACM) can update [Acceleration time] (ACt), [Lift leveling speed] (LLS) and / or [Lift leveling time] (LLt).

Whatever the optimization choices, [Comfort accel.] (ACM), [Lift top speed] (LtS), [Deceleration length] (dEL) and [Stop length] (StL) parameters cannot be changed.

The setting of optimization parameters must be done as the last step of commissioning. During this optimization phase, if the application description parameters are modified to some unacceptable values, then it is necessary to modify them again.

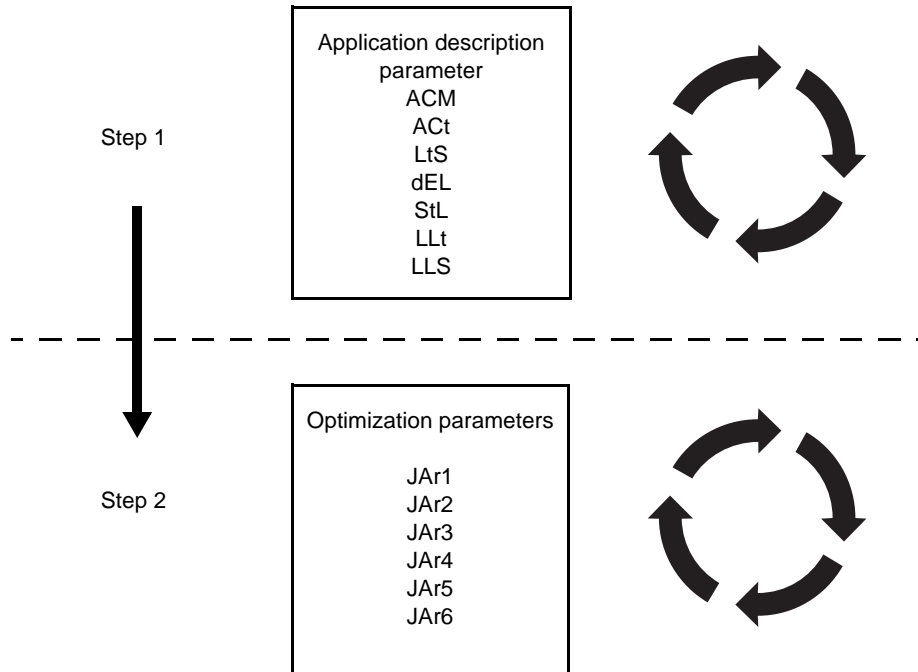

In this case, any modification of one of the application description parameters will reset the optimization parameters.

Parameters management (continued)

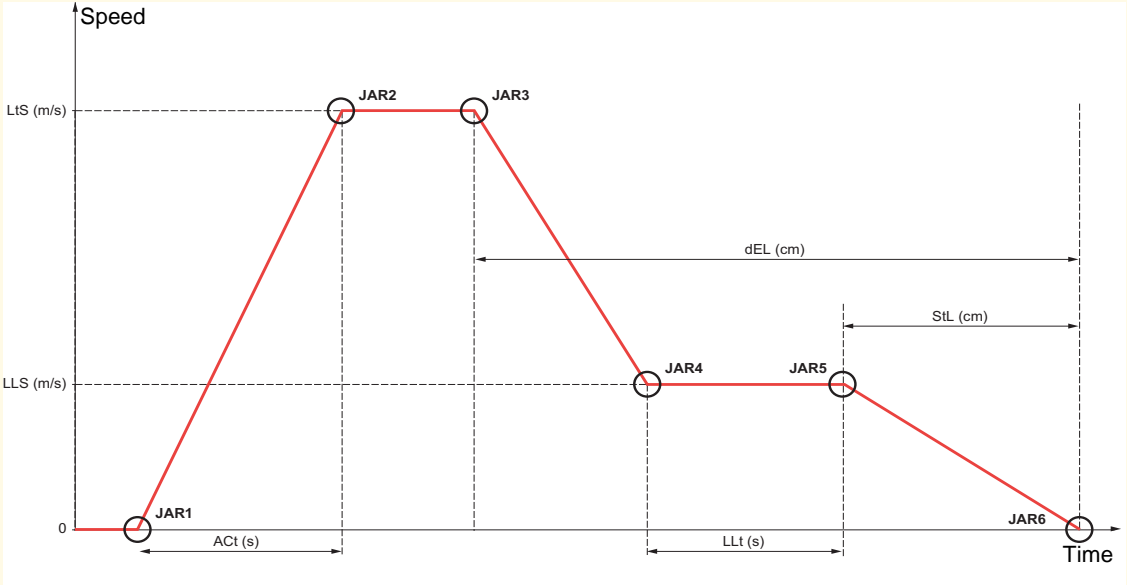

In conclusion, the lift menu allows to adjust the ramp in 2 steps.

Step 1 : Adjust only the application description parameters. Once these parameters are well adjusted, go to the second step.

Step 2 : Adjust optimization parameters.

[1.1 LIFT] (LIF-)

Code	Name/Description	Adjustment range	Factory setting

L J A -	[LIFT DATA] continued		
L L S	<input type="checkbox"/> [Lift top speed] <p>This parameter can be accessed if [Lift Speed Mgt] (LSM) is not [No] (nO) or if [selector input A] (SPSA) and [selector input B] (SPSb) are not set to [No] (nO). The travel speed corresponds to the linear speed of the car in steady state (high speed). This can be less than the [Nominal car speed] (CSP) if the motor is oversized in relation to the installation.</p> <p> Note: [Lift top speed] (LTS) depends on [Nominal car speed] (CSP), [High speed] (HSP) and [Rated motor freq.] (FRS) parameters.</p>	0.10 to 10.00 m/s	1.00 m/s
A C L	<input type="checkbox"/> [Acceleration time] <p>This parameter can be accessed if [Lift Speed Mgt] (LSM) is not [No] (nO) or if [selector input A] (SPSA) and [selector input B] (SPSb) are not set to [No] (nO). The acceleration time corresponds to the time the car will take to attain its [Lift top speed] (LTS). The acceleration time should be consistent with the desired travel speed so that the car travels at a constant speed for at least a few seconds.</p> <p>If the acceleration time is too short, acceleration will be too strong, making the ride uncomfortable.</p> <p>If the acceleration time is too long, the travel speed can never be attained and the half floor function will then be activated systematically. The travel time will not therefore be optimized for normal floors.</p>	0.50 to 60.00 s	3 s
	 <p>The graph plots Speed (m/s) on the y-axis against Time on the x-axis. It shows a trapezoidal profile with a low-speed section. Key points are marked with JAR1 through JAR6. JAR1 is at the start of acceleration. JAR2 and JAR3 are at the start and end of the high-speed constant velocity phase. JAR4 and JAR5 are at the start and end of the low-speed constant velocity phase. JAR6 is at the end of deceleration. Parameters shown include ACt (acceleration time), LLt (low speed time), dEL (distance between JAR2 and JAR3), and StL (stop length).</p>		
S L L	<input type="checkbox"/> [Stop length] <p>This parameter can be accessed if [Lift Speed Mgt] (LSM) is not [No] (nO) or if [selector input A] (SPSA) and [selector input B] (SPSb) are not set to [No] (nO).</p> <p>The stop length corresponds to the distance separating the stop indicator from the step the car is destined to reach. The drive considers the [Stop length] (StL) as being the distance still to be traveled by the car when the drive loses the run command. This distance is taken into account when calculating the deceleration profile.</p>	1.0 to 300, 0 cm	10.0 cm

[1.1 LIFT] (LIF-)

Code	Name/Description	Adjustment range	Factory setting
LCD-	[LIFT CONFIGURATION] continued		
LDR-	[LIFT DATA] continued		
LLS	<input type="checkbox"/> [Lift leveling speed] This parameter can be accessed if [Lift Speed Mgt] (LSM) is not [No] (nO) or if [selector input A] (SPSA) and [selector input B] (SPSb) are not set to [No] (nO) . The lift leveling speed is calculated by the drive automatically. If the calculated speed is not suitable (because it corresponds to a mechanical resonance frequency for example), it can be re-entered manually. In this case, the lift leveling time should be recalculated. The [Lift leveling speed] (LLS) can't be greater than the [Lift top speed] (LtS) .	0.01 to 0.50 m/s	0.10 m/s
LLt	<input type="checkbox"/> [Lift leveling time] This parameter can be accessed if [Lift Speed Mgt] (LSM) is not [No] (nO) or if [selector input A] (SPSA) and [selector input B] (SPSb) are not set to [No] (nO) . The lift leveling time corresponds to the time the car will spend at lift leveling speed in steady state. If the lift leveling time is too short, the ride will be uncomfortable (rolling sensation). If the lift leveling time is too long, the ramp between LtS and LLS will be intense (loss of comfort).	0.50 to 10.00 s	2.00 s
dEL	<input type="checkbox"/> [Deceleration length] This parameter can be accessed if [Lift Speed Mgt] (LSM) is not [No] (nO) or if [selector input A] (SPSA) and [selector input B] (SPSb) are not set to [No] (nO) . The slowdown length corresponds to the distance separating the slowdown indicator from the floor the car is destined to reach. The drive considers the dEL as being the distance still to be traveled by the car when the drive receives the low speed signal (or loss of the high speed signal). This distance is taken into account when calculating the deceleration profile. [Deceleration length] (dEL) can't be shorter than [Stop length] (StL)	10.0 to 999.9 cm	120.0 cm

[1.1 LIFT] (LIF-)

Ramp optimisation

Jerks JAr1 to JAr6 correspond to the maximum permissible jerk values for each rounding.

If one of the roundings is not satisfactory (for example: starting too sudden) it can be re-entered manually. In this case, the associated rounding (for example: arrival at travel speed) will automatically be revised to keep it consistent. Some application data can also be modified (travel speed, lift leveling time, acceleration time). However, the slowdown and stop lengths are adhered to.

[1.1 LIFT] (LIF-)

Velocity Loop

The ATV LIFT speed loop helps to ensure optimum comfort in the lift car while complying with the speed references produced by the automatic ramp profile.

The ATV LIFT speed loop is configured automatically by the drive from the application data (car speed and payload).

In the majority of applications, there is no need to re-enter the speed loop settings. However, if you are not satisfied with the lift behavior, refer to the Procedure for setting the speed loop paragraph on page [71](#).

Description of the loop

The ATV LIFT speed loop consists of the following elements:

- [Fr.Loop.Stab] (StA): Stability (attenuation coefficient)
- [FreqLoopGain] (FLG): Gain (passband)
- [K speed loop filter] (SFC): Reference filter constant
- [Real motor inertia] (JMOT) and [Estim. motor inertia] (JCAL): Motor inertia (JMOT can be accessed in read/write mode and JCAL is read-only).
- [Application Inertia] (JAPL): Application inertia (pre-calculated)

The total inertia used in the loop is

- JMOT + JAPL when JMOT is not 0
- JCAL + JAPL when JMOT = Auto

In expert mode:

- [Feed forward] (FFP): Feed forward term gain
- [Bandwidth feedfor.] (FFU): Feed forward term bandwidth

This description of the loop can include the filter on the speed measurement, as it is closely linked to the final setting of this loop:

- [Encoder filter value] (FFr): Filter time constant
- [Encoder filter active] (FFA): Activation of the filter

Here then is the block diagram for this speed loop:

[1.1 LIFT] (LIF-)

Basic operation

In the case of standard operation, the speed loop should be preset using the [Capacity of the lift] (LCA) and [Nominal car speed] (CSP) parameters as follows:

1. The total weight of the application is estimated using [Capacity of the lift] (LCA)
2. The total inertia of the application is estimated using the total weight, [Nominal car speed] (CSP) and [Nom motor spdsync] (nSPS) (or [Rated motor speed] (nSP) for asynchronous motors)
3. The speed regulator bandwidth and attenuation are predefined and adapted to the lift application
4. The regulator is predefined as being a PI speed regulator (SFC = 100%) for synchronous motors and as having intermediate behavior between a PI and an IP for asynchronous motors (SFC = 65%). Note: An IP speed regulator is obtained if SFC = 0%.
5. The filter constant applied to the speed reference is calculated using SFC
6. The speed controller **Kp and Ki gains** are calculated using the inertia, the bandwidth and the attenuation
7. The lift speed loop also has an additional **feedforward compensation** term for the acceleration and deceleration torque. By default this is not active. Its gain can be set by [Feed forward] (FFP), set initially at 0%. This term is based on an acceleration observer whose predefined bandwidth corresponds to [Bandwidth feedfor.] (FFU) = 100%. This can be modified if necessary.
8. When a closed-loop control profile (with speed feedback) is being used, there is the possibility of using a **filter on the measured speed**, to reduce the measurement noise. This filter is preset according to the [Motor torque] (TqS) and the resolution of the encoder used (resolution detected automatically)

Thus, in the case of fairly good correspondence between the drive inertia and the actual inertia, for the usual lift ramps, an encoder with resolution $>2^{16}$ (\Rightarrow [Encoder filter value] (FFR) = 3 ms), the actual speed should follow the reference speed exactly:

In the above example, the default inertia is that of the drive and the inertia parameter equals the default inertia. The roundings are all at 50% and the ramps at 3 s.

[1.1 LIFT] (LIF-)

Procedure for setting the speed loop

This procedure must be used in inspection mode (see page 38). The lift ramps should then be set. It can be re-entered from setting item 6 in normal operation if necessary.

As explained in previous sections, **the inertia** must be set.

1. Start by entering the lift capacity [Capacity of the lift] (LCA) correctly and checking that the linear speed [Nominal car speed] (CSP), [Rated motor speed] (nSP) or [Nom. motor spdsync] (nSPS) and rated frequency for asynchronous motors [Rated motor freq.] (FrS) or the number of pole pairs for synchronous motors [Pole pairs] (PPnS) are entered correctly
2. The [Car weight] (CMA) et [Counterweight] (CtM) parameters are updated again depending on [Capacity of the lift] (LCA), and therefore the total inertia of the application is calculated. If the the car weight and counterweight weight are known, it is better to enter them separately
3. The synchronous motor torque [Motor torque] (tqS) and the number of motor pole pairs [Poles pair number] (PPn) or [Pole pairs] (PPnS) update the estimated motor inertia (JCAL in read-only and [Real motor inertia] (JMOT) in read/write mode). If the motor inertia is known, it is better to enter it in [Real motor inertia] (JMOT). You should be aware that our estimate of the inertia takes account of a "long cylinder" lift motor model. If a flat lift motor is used, it is vital to fill in this parameter.

To sum up, in order to find the inertia you should enter:

At minimum	As a preference
[Capacity of the lift] (LCA) [Nominal car speed] (CSP) [Rated motor speed] (nSP) or [Nom motor spdsync] (nSPS) [Motor torque] (tqS) [Poles pair number] (PPn) or [Pole pairs] (PPnS)	[Capacity of the lift] (LCA) [Nominal car speed] (CSP) [Rated motor speed] (nSP) or [Nom motor spdsync] (nSPS) [Motor torque] (tqS) [Poles pair number] (PPn) or [Pole pairs] (PPnS)
	[Car weight] (CMA) [Counterweight] (CtM) [Real motor inertia] (JMOT)

4. When little is known about the parameters (weights, rated speed, etc.), the total application inertia can be set directly as follows:
 - Increase [Real motor inertia] (JMOT) and/or [Capacity of lift] (LCA) (to increase [Application Inertia] (JAPL)) up to the system stability limit (noise and strong vibrations in the car)
 - Reduce [Real motor inertia] (JMOT) and/or [Capacity of lift] (LCA) (to reduce [Application Inertia] (JAPL)) to help to eliminate strong vibrations; these can be reduced until slow oscillations on the speed or speed overshoots occur which are easily felt in the car; in this case the inertia should be increased again
5. The default values of StA, FLG, SFC, FFP, FFU are suitable in the vast majority of cases. The pre-calculated value of [Encoder filter value] (FFR) is suitable in the vast majority of applications.

Exceptions:

6. A very loud noise and rapid oscillations on starting in inspection mode can be due to overestimation of the inertia (see "Influence of the [Fr.Loop.Stab] (StA) et [FreqLoopGain] (FLG)" paragraph, page 76). The parameters involved in calculating the inertia, items 1, 2 and 3, should be reviewed.
7. Should the revised inertia (item 4) not give satisfactory results, it is possible to make the control system slacker, by reducing [FreqLoopGain] (FLG) and/or increasing [Fr.Loop.Stab.] (StA), or more reactive, by increasing [FreqLoopGain] (FLG) and/or reducing [Fr.Loop. Stab.] (StA) (see "Influence of the [Fr.Loop.Stab.] (StA) and [FreqLoopGain] (FLG)parameters" paragraph).
8. Background noise (high-frequency vibration) during operation or during rollback can be reduced by increasing the [Encoder filter value] (FFr) parameter (see "Influence of the [Encoder filter value] (FFr) parameter" paragraph, page 80). In this case, do not forget to re-enter [FreqLoopGain] (FLG) if necessary.
9. If it is necessary to reduce [Encoder filter value] (FFr) for the rollback (to have a faster reaction) and if the system allows it (without increasing the background noise), there is no need to re-enter [FreqLoopGain] (FLG), because it will also be correct for a smaller [Encoder filter value] (FFr).
10. If a system mechanical resonance is reached at a particular speed, rather slow oscillations may appear. You can:
 - Reduce [FreqLoopGain] (FLG)
 - And/or increase [Fr.Loop.Stab] (StA)
 - And/or increase [Feed forward] (FFP) (to increase the gains only in transient operation, not at steady state)
 - And/or reduce [K speed loop filter] (SFC) (in this case you need to re-enter the ramp settings, as delays will be introduced during speed following)

[1.1 LIFT] (LIF-)

Influence of the [FreqLoopGain] (FLG) and [Fr.Loop.Stab] (StA) parameters

These parameters are used to adjust the response of the speed loop obtained from the inertia, in particular when this is not known.

- [Fr.Loop.Stab] (StA): Used to adapt the return to steady state after a speed transient, according to the dynamics of the machine. Gradually increase the stability to increase control loop attenuation and thus reduce any overspeed.
- [FreqLoopGain] (FLG): Used to adapt the response of the machine speed transients according to the dynamics (passband). For machines with high resistive torque, high inertia or fast cycles, increase the gain gradually.

Increase in FLG ↗

Reference division

Increase in FLG ↗↗

Reference division

For a better understanding of the influence of the [FreqLoopGain] (FLG) and [Fr.Loop.Stab] (StA) parameters, we will look at 2 types of example:

- A very short linear ramp (a very unlikely scenario for the lift, but very useful for the example)
- The same ramp rounded (ACC=DEC=3s) as before (like the lift)

1. Very short linear ramp

--- Reference speed
 Actual speed
 ——— Measured speed

--- Reference speed
 Actual speed
 ——— Measured speed

—— torque

—— torque

1) Default loop settings, $J_{var} = J_{real}$

2) Fig. 1 + STA increased to 80

[1.1 LIFT] (LIF-)

3) Fig. 2 + FLG increased to 60

4) Fig. 3 + FLG increased to 100

5) Fig. 4 + STA decreased to 20

6) Fig. 5 + STA decreased to 5

7) Fig. 6 + FLG decreased to 20

8) Fig. 7 + FLG decreased to 5

2. Ramp rounded to 3 s

1) Default loop settings $J_{var} = J_{real}$

2) Fig. 1 + STA increased to 80

3) Fig. 2 + FLG increased to 60

4) Fig. 3 + FLG increased to 100

5) Fig. 4 + STA decreased to 5

6) Fig. 5 + FLG decreased to 5

From these latest figures (except the last), we can see the influence of [FreqLoopGain] (FLG) and [Fr.Loop.Stab] (StA) when the inertia is well defined (drive inertia adapted to the actual inertia). In summary, only an important dip in the [FreqLoopGain] (FLG) (bandwidth) can make the control system very slack, and therefore oscillating.

[1.1 LIFT] (LIF-)

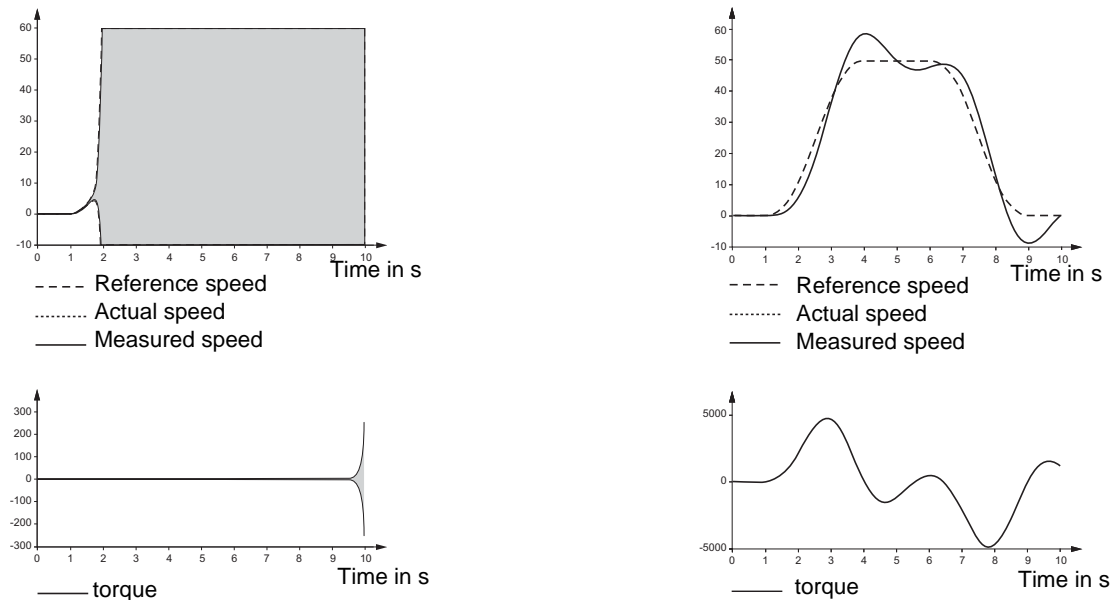

Robustness of basic operation

Speed following is very robust when large variations of inertia occur. Let us look at the same example (with all default values, except for inertia):

Underestimation of the inertia by a factor of 5 (actual inertia is 5 kg.m²) is also hardly noticeable.

Underestimation of the inertia (actual inertia is 0.1 kg.m²) brings the system toward the limit of stability, but a factor of 10 is acceptable.

Significant overestimation of the actual inertia (ratio 33.33).

Significant underestimation of the actual inertia (ratio 20).

Note that underestimation by a ratio of 30 is preferable to overestimation by a ratio of 30, since the control system remains stable (**Note:** in this case the response will be too slow and the lift will be caught too late).

[1.1 LIFT] (LIF-)

Influence of the [FreqLoopGain] (FLG) and [Fr.Loop.Stab] (StA) parameters for the ATV LIFT

Given these latest results, in the great majority of lift applications, there is no point in changing the settings of [Fr.Loop.Stab] (StA) and [FreqLoopGain] (FLG).

Moreover, the settings of StA/FLG differ from the default values and usually hide incorrectly defined inertia:

Inertia underestimated by a ratio of 10, default loop values.

An increase of FLG to 100% improves the speed following while producing torque oscillations.

Significant overestimation of the actual inertia (ratio 33.33).

A decrease of FLG improves the speed following, while nonetheless covering incorrect estimation of the inertia.

The inertia should therefore be redefined rather than changing the gains [FreqLoopGain] (FLG) or [Fr.Loop.Stab] (StA).

However, even in the case of well defined inertia, it is sometimes useful to reduce the gain [FreqLoopGain] (FLG) or increase the stability [Fr.Loop.Stab] (StA) to make the system even slacker. A slack control system is useful for example to avoid exciting the mechanical resonance frequencies of the lift or the motor.

[1.1 LIFT] (LIF-)

E.g.

Let's consider that the mechanical system is causing a resonance at the speed used. Even if the speed is followed correctly, the torque oscillations show discomfort.

By reducing FLG the little oscillations reduce, giving way to larger oscillations which are felt less in the car.

By increasing STA to 100%, the system is dampened further. This reduces the oscillations.

[1.1 LIFT] (LIF-)

Another example of the advantage of the slacker system is when you need to use a very large filter on the speed measurement (also see section on [Encoder filter value \(FFr\)](#)):

Very short ACC ramp (0.1 s), very long FFR (40 ms).

Reducing the passband FLG helps to eliminate the speed oscillations.

[1.1 LIFT] (LIF-)

Influence of the [K speed loop filter] parameter (SFC)

The filter on the speed reference converts the PI regulator (SFC = 100%) to an IP regulator (SFC = 0%).

An IP regulator has no overshoot. The consequence is a delay in the actual speed compared to the reference speed.

In the great majority of lift applications it should be left at the default value: 100% for synchronous motors, 65% for asynchronous motors.

It can be useful when using steep ramp profiles. However, it could be said that in this case it hides an incorrect definition of the ramp rounds. Nonetheless, it can be seen as another degree of freedom for increasing comfort.

Inertia underestimated (ratio 3), rounding of end of ramp 10%, SFC = 100%

If SFC = 65%, a good compromise between the speed overshoot and the delay on the command is obtained.

If SFC = 0%, there is no speed overshoot and comfortable jerks are obtained.

We should also point out that the reduction in [K speed loop filter] (SFC) also improves behavior in the event of mechanical resonance. In this case, it can be used even together with the increase in [Fr.Loap.Stab] (StA) and/or the reduction in [Freq Loop Gain] (FLG).

[1.1 LIFT] (LIF-)

Influence of the [Encoder filter value] (FFr) parameter

The [Encoder filter value] (FFR) filter is pre-positioned in the case of the lift to a value that depends on the actual encoder resolution and the rated motor torque. It can be modified as follows:

- **The FFR value is increased** to reduce the acoustic noise or background (high frequency) vibration in the cables; this vibration is usually due to the measurement noise (quality of the encoder cables, EMC interference, length of cable etc.).
- **FFR is reduced** to be able to increase (with the other dynamic gains) the dynamics of the response

For a better understanding of the filter's influence on the measured speed, we will also look at the example of a short ramp (the influence of this parameter for the usual lift application ramps is much less pronounced):

Example with PI structure 100%

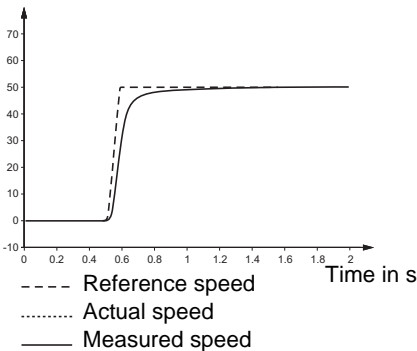

Default loop settings, $J_{var} = J_{real}$, ACC = 0.1 s, FFR = 3 ms

Very long FFR (40 ms).

Remember that the speed oscillations that appear in this latter case can be reduced by decreasing [FreqLoopGain] (FLG) (see section on the advantages of [FreqLoopGain] (FLG) and [Fr.Loop.Stab] (StA)), page 72).

Example with an intermediate PI/IP structure (SFC = 80%):

SFC = 80%, FFR = 3 ms

SFC = 80%, FFR = 40 ms: A system without overshoot can be converted into a system with overshoot and a little oscillation due to too much filtering on the speed feedback.

In this case too, [FreqLoopGain] (FLG) must be reduced to reduce oscillations (and overshoots).

You should be aware that too large a filtering constant reduces the performance of the rollback function, since the rollback gains will be applied to the filtered speed.

The FFR setting will therefore be a compromise between the noise and oscillations in normal operation and rejection of interference by the rollback.

[1.1 LIFT] (LIF-)

Use of [Feed forward] (FFP) and [Bandwidth feedfor.] (FFU)

This is optional in the case of lifts, such as applications with fairly slow dynamics (ramps 3 s, significant rounding, high inertia).

[Feed forward] (FFP) is used to adjust the level of dynamic torque feedforward required for accelerating and decelerating the inertia. The effect of this parameter on ramp following is illustrated below. Increasing the value of FFP allows the ramp to be followed more closely. However, if the value is too high, overspeed occurs. The optimum setting is obtained when the speed follows the ramp precisely; this depends on the accuracy of the [Application Inertia] (JAPL) parameter, page 82, and the [Encoder filter value] (FFr) parameter setting, page 189.

Initial response with FFP = 0

Reference division

Increase in FFP ↗

Reference division

Increase in FFP ↗↗

Reference division

Increase in FFP ↗↗↗

Reference division

As we have shown in the "Robustness of basic operation" paragraph, page 75, [Feed forward] (FFP) can be useful to hide inertia estimation errors.

[Feed forward] (FFP) can also be used to separate the effect of the Kp and Ki speed regulator gains, on acceleration/deceleration and during steady state operation (this term only acts on a change of speed reference, therefore only in transient operation).

The [Feed forward] (FFP) parameter serves no purpose during rollback, since there is no acceleration of the reference (speed reference 0 Hz).

[Bandwidth feedfor.] (FFU) is used to adjust the bandwidth of the dynamic torque feedforward term. The effect of this parameter on ramp following is illustrated below. Decreasing the value of FFU reduces the effect of noise on the speed reference (torque ripple). However, too great a decrease in relation to the ramp settings (on short ramps) causes a delay, and ramp following is adversely affected. Increasing the value of FFU allows the ramp to be followed more closely, but also heightens noise sensitivity. The optimum setting is obtained by reaching the compromise between ramp following and the existing noise sensitivity.

Initial response with FFU = 100%

Notch filter

Vibrations naturally exist in lift systems and have disturbing consequences as noises and/or vibrations in the car.

These vibrations can come from mechanical roots as

- the elastic ropes resonance,
- impacts at guide rail joint,
- conjunction between guide rail and guide shoe,
- high ratios between the inertia of the application and of the motor (typicalli in direct drive application with no gear box),

and also electric noise coming from the motor.

To improve comfort the ATV LIFT drive provides 2 optional notch filters to reject effects of the mechanical resonance and consequently improve the speed behaviour.

The notch filter attenuates a band of frequencies around its central frequency within it bandwidth and with maximum attenuation defined by its depth :

- NFFx : Filter central frequency,
- NFBx : Bandwidth of the attenuation that will be applied by the filter (with of the notch),
- NFDx : Depth of the attenuation that will be applied by the filter.

When vibrations are rejected significant improvement of overall travel comfort is achievable. In particular:

- Speed loop setting is easier and less dependant on the system parameter variation (load, lift car position etc.).
- Speed loop damping is improved and lift car vibrations are reduced.
- Increased speed loop gains can be used for better speed ramp tracking and more accurate level positioning.
- Increased gains of the roll back controller are achievable without incurring vibrations in the car.

[1.1 LIFT] (LIF-)

The ATV LIFT provides 2 identical cascaded notch filters that can be configured and enabled independently.

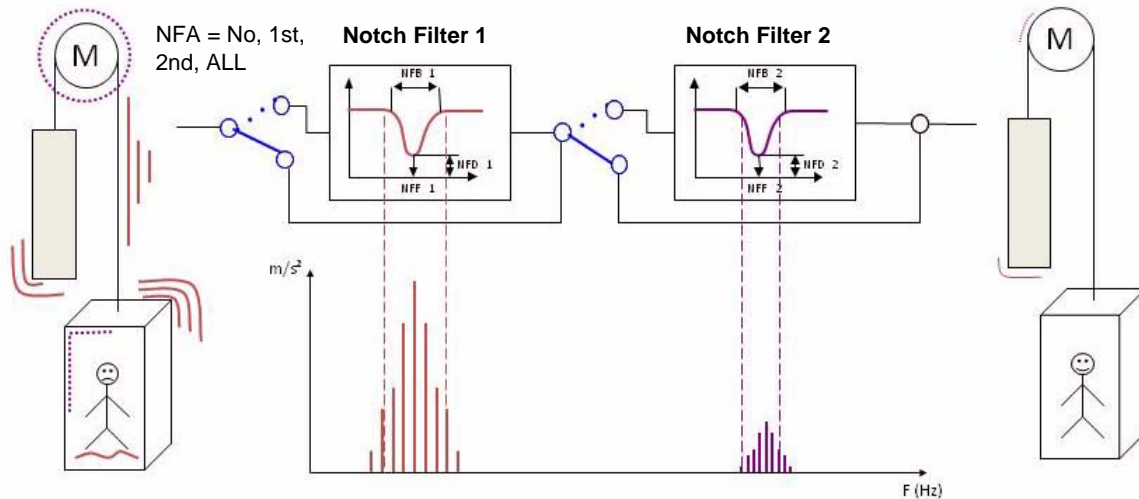

By default, notch filter 1 is set to provide compensation of the typical lift mechanical resonant mode which is can be usually found in 15 Hz..25 Hz range.

The default settings of notch filter 2 are selected to provide additional attenuation at higher frequencies if the notch filter 1 can not be set to provide sufficiently attenuation in the frequency range required in a particular lift installation (typically with very high load/motor inertia mismatch).

Usually, using only notch filter 1 with its default settings is sufficient to remove vibrations that are felt in the car.

The ATV LIFT provides 2 different notch filters that can be configured and enable independently: the default setting of notch filter 1 concerned mechanical vibrations while default setting of notch filter 2 concerned electrical vibrations.

Usually, using only notch filter 1 with its default values is sufficient to remove vibrations that are felt in the car.

Commissioning

Activation of the notch filter should be typically considered in direct drive applications (no gear boxes) where load to motor inertia ratio is high. The notch filter central frequency should be set at or slightly higher than to the mechanical resonant frequency. The mechanical natural resonant frequency can be detected if the mechanical system is excited by sudden torque variations. So the main task is to identify as close as possible the resonant frequency.

To commission properly the notch filter 1 and in order to be sure that the origin of these vibrations is mechanical resonance, a simple test may be done:

- remove roll-back management,
- start in inspection,
- stop.

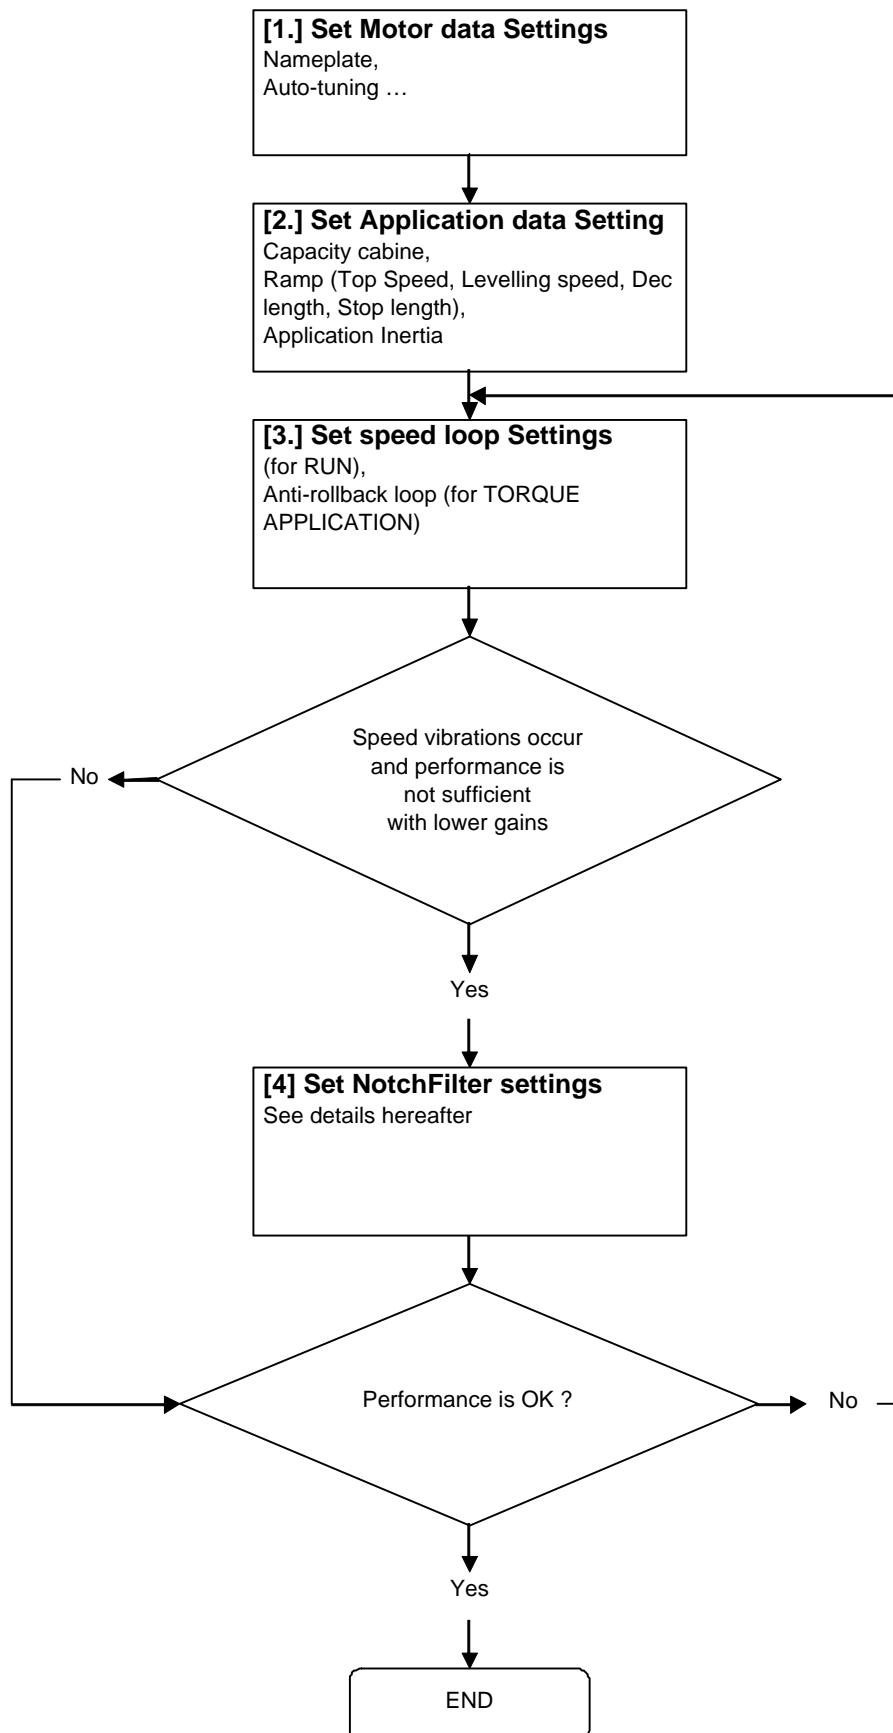

During stop during down movement with empty car at mid in **freewheel**, the measured speed will contain the resonant frequencies of the application. The speed may be observed with an external equipment (tachometer for example).

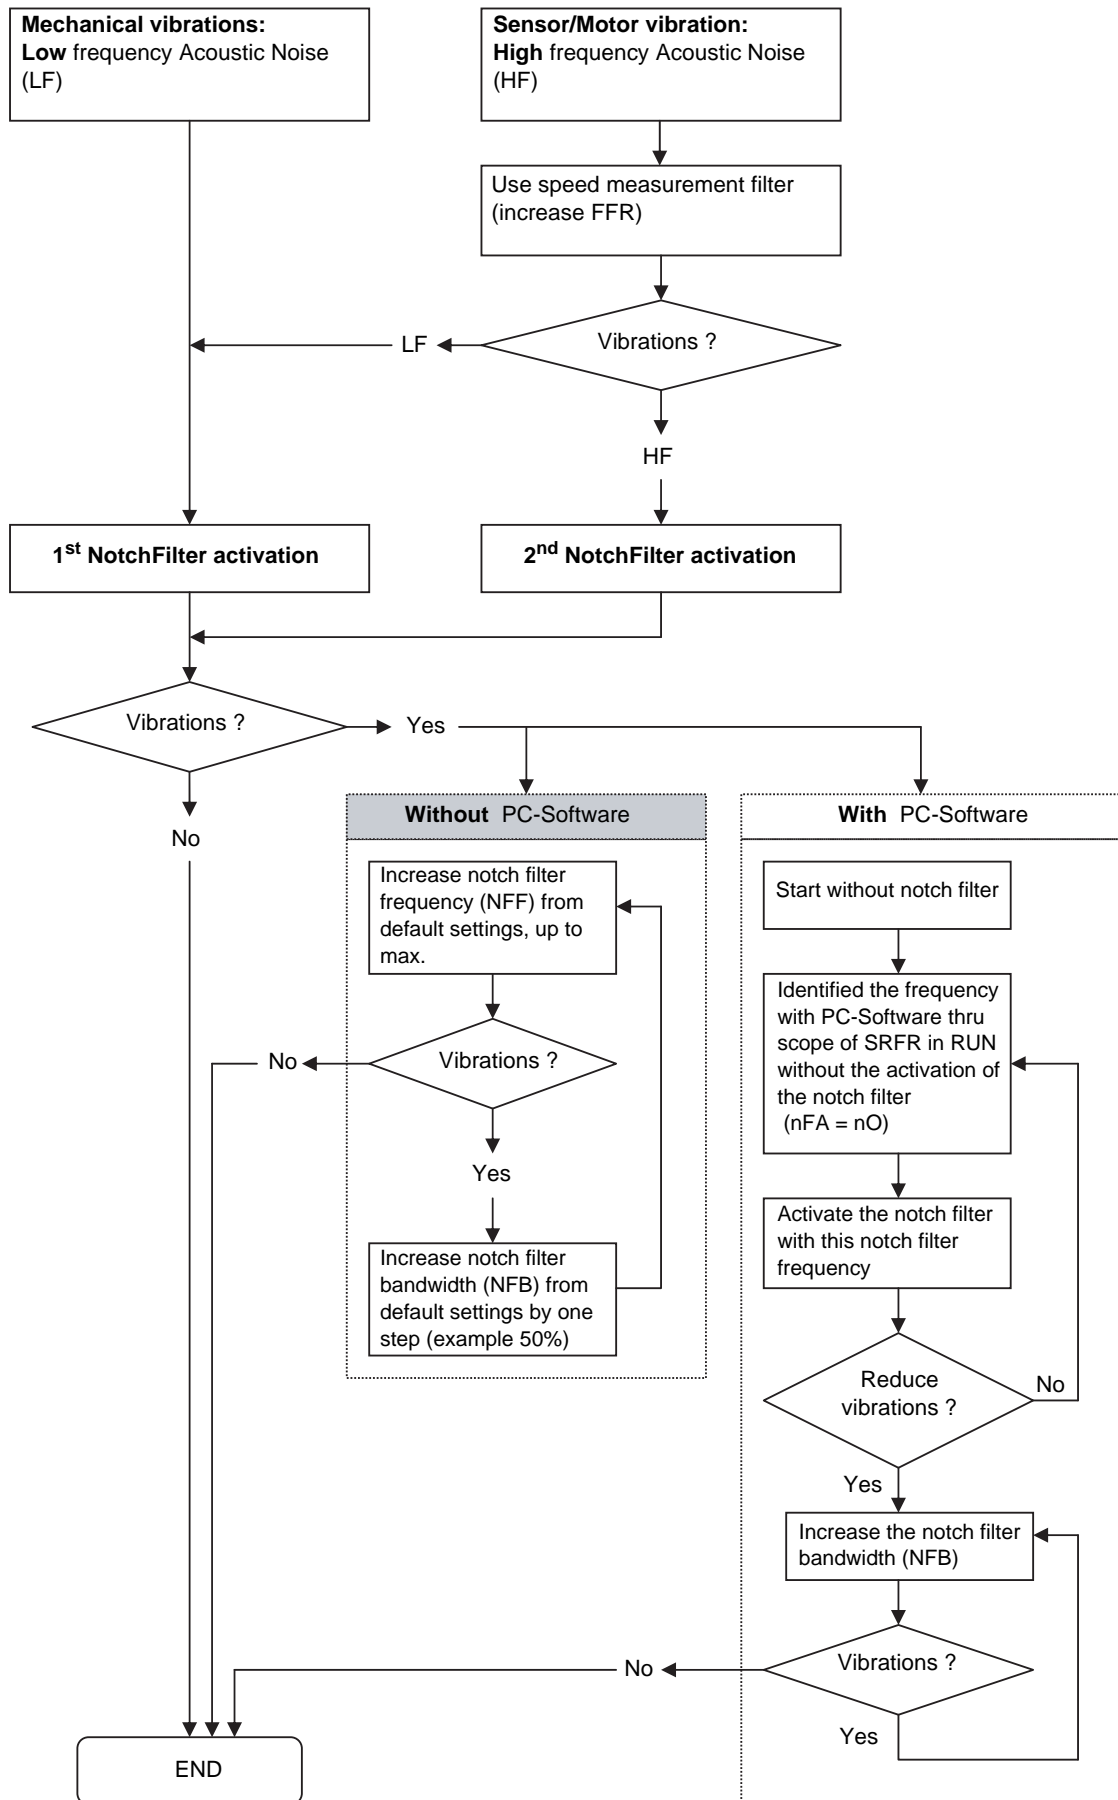

If it is impossible to measure the speed, we should consider that usual mechanical resonances are between 15 and 25 Hz.

Remark: Possible speed vibrations seen during drive run normally appear at frequencies higher than the mechanical resonant frequency depending on the settings of the speed loop, speed-back filter and motor parameters. Thus it is important to identify real natural resonance frequency (above explained observation during free wheeling is one possibility).

(1) In corresponds to the rated drive current indicated in the Installation Manual or on the drive nameplate.

Rollback management

In some lift applications (gearless with high inertia), a jolt can be felt in the car at the start of any movement when the brake is released. At this moment (since there is no external weight sensor), the torque applied by the motor is not yet at the level needed to hold the car. A slight movement (up or down, depending on the general equilibrium) occurs. This movement is known as a "rollback".

The [Rollback MGT] (rbM) function, page 90 can only be accessed in closed-loop mode ([Motor control type] (Ctt) , page 146 = [Sync.CL] (FSY) or [FVC] (FUC)). It increases the drive's rigidity control during release of the mechanical brake to cancel any movement during the brake release time ([Brake Release time] (brt) , page 88).

The [Rollback MGT] (rbM) function can be used to avoid the effects of rollback once the following parameters have been set:

- The speed loop parameters must be set and must not be modified after the [Rollback MGT] (rbM) function has been activated.
- The [Encoder filter value] parameter (FFr) page 48 must be configured with an appropriate value and must not be modified after the [Rollback MGT] (rbM) function has been activated.
- The current parameter [Brake release I FW] (lbr) page 88 can be adjusted to apply a current level corresponding to the most common load scenario (approximately 25% of the total load).
- The brake release sequence must be configured with an appropriate brake release time [Brake Release time] (brt) (typically brt > 1 second).

Recommended settings:

- Set the speed loop correctly in order to have satisfactory rollback management (correct ramp following and well damped response). Initial optimisation of the initial speed loop must be performed using the [Rollback MGT] (rbM) function = [No] (nO) (deactivated).
- We recommend gradually increasing the [Rbk Compensation] (rbC) gain from 0 until the rollback movement is reduced to the desired level.
- If vibrations occur while the [Rbk Compensation] (rbC) gain is being increased, it must be reduced until these stop. It is possible to increase damping with the [Rbk Damping] (rbd) parameter, this allows the [Rbk Compensation] (rbC) gain to be increased again.
- **Note:** A high setting of the [Rbk Damping] (rbd) parameter can amplify the encoder noise. It is therefore advisable to keep the value as low as possible.
- The performance of the rollback compensation function will be limited by the system resonance frequencies and the encoder feedback resolution. Encoders with a low resolution do not necessarily offer the desired rollback management.
- **Note:** You should allow adequate time after the brake is released and prioritize starting of the speed ramp to control the rollback in order to stabilize the lift position.

Start-up stiffness boost

The Start-up stiffness boost adapts the IBR current level according to the encoder feedback while the brake is opening. The Start-up stiffness boost operates during the first part after the Run order: when the load torque becomes predominant and when the braking torque due to the mechanical brake progressively reduces. At the end of the braking operation, the resulting opening current level set in the parameter IBR is internally re-adjusted according to the response of the system.

External weight measurement

This function uses the information supplied by a weight sensor to adapt the current [Brake release I FW] (*I_{br}*) of the [BRAKE LOGIC CONTROL] (*bLC-*) function. The signal from the weight sensor can be assigned to an analog input (usually a 4 - 20 mA signal), to the pulse-in input or to the encoder input, according to the type of weight sensor.

Examples include

- Measurement of the total weight of a hoisting winch and its load.
- Measurement of the total weight of an elevator winch, the cabin and counterweight.

The current [Brake release I FW] (*I_{br}*) is adapted in accordance with the curve below.

This curve can represent a weight sensor on an elevator winch, where zero load on the motor occurs when the load in the cabin is not zero.

tEt (C)	<input type="checkbox"/> [Brake engage delay] Time delay before request to engage brake. To delay brake engagement, if you wish the brake to be engaged when the drive comes to a complete stop.	0.00 to 5.00 s (1)	0 s
bECd	<input type="checkbox"/> [Brake engage at 0] Brake engages at regulated zero speed. This parameter can be accessed if [Motor control type] (Ctt) page 146 = [FVC] (FUC) or [Sync.CL] (FSY). Can be used to engage the brake at zero speed in closed-loop mode with speed regulation. This parameter can be used to adjust the brake engage delay once zero speed has been reached. If a speed other than zero is then required, the command to release the brake is sent following torque application. <input type="checkbox"/> [No] (nO): Brake does not engage at regulated zero speed. <input type="checkbox"/> 0.0 to 30.0 s: Brake engage delay once zero speed is reached.		[No] (nO)
nD -			

(1) Parameter can also be accessed in the [1.3 SETTINGS] (SEt-) menu and in the [1.7 APPLICATION FUNCT.] (FUN-) menu.

 Parameter that can be modified during operation or when stopped.

Inspection

It can only be accessed if the [\[Brake assignment\] \(bLC\)](#) page [240](#) function have already been assigned.

It is used for operation at a fixed preset speed that is independent of all other references and over which it takes priority. The whole trajectory of the elevator can thus be covered and the necessary checks performed.

This function requires:

- A logic input to control the "inspection" mode.
- An appropriate frequency reference (inspection speed).

When the assigned logic input is at active state, inspection mode is activated:

- When a run command is given, the motor starts up normally, with output contactor command and brake logic control, until it reaches the inspection speed.
- When the run command is disabled, the motor changes to freewheel stop and brake logic control and output contactor command functions are triggered immediately.

Note: If evacuation function is activated and [\[Opt. rescue mode\] \(OrM\)](#) (see page [265](#)) is set to [\[Automatic\] \(AUtO\)](#), then inspection operation is possible in the direction autodetected by the drive. A run order in the other direction will not start the motor.

[1.1 LIFT] (LIF-)

Inspection mode

(2) Range 0.01 to 99.99 s or 0.1 to 999.9 s or 1 to 6000 s according to [Ramp increment] (Inr).

[1.1 LIFT] (LIF-)

Evacuation function

When a lift is stuck between 2 floors due to a power outage, it must be possible to evacuate its occupants within a reasonable period of time. This function requires an emergency power supply to be connected to the drive. This power supply is at a reduced voltage, and only allows a derated operating mode, at reduced speed, but with full torque.

This function requires:

- One logic input to control "evacuation" operation
- Reduction of the voltage monitoring threshold
- An appropriate low speed reference

Following a power outage, the drive can restart without having to clear the [Undervoltage] (USF) state if the corresponding logic input is at active state at the same time.

⚠ DANGER

UNINTENDED EQUIPMENT OPERATION

- This input must not be at active state when the drive is powered from the line supply. To ensure this and also avoid any short-circuits, supply changeover contactors must be used.
- Set this input to 0 before connecting the emergency power supply to the line supply.

Failure to follow these instructions can result in equipment damage.

The optimized rescue function [Opt. rescue mode] (OrM) offers 3 possible modes:

- **Standard mode:** This is the the Evacuation mode existing on ATV71L. This mode does not take into account the lift ramp parameters. The drive is using linear ramps and is running at the evacuation frequency defined by the parameter [Evacuation freq.] (rSP).
- **Optimized mode:** The target of this mode is to identify the direction which requires the less power in order to optimize the emergency power supply size. The speed reference used during rescue is given by the LIFT ramp, taken into account the [Cust. rescue speed] (OrSP) speed limitation and the specific acceleration time [Acc. time rescue] (rACC).
The optimized direction for rescue mode is available on a logic output if set to [Rescue dir.] (Opt). If the output is at active state (1), it means that the forward direction requires less power than reverse. The output at passive state (0) means that the reverse direction requires less power than forward.
 - **Manual optimized mode:** the drive can start in both directions.
 - **Automatic optimized mode:** the drive will start only in the direction that requires the less power.

⚠ DANGER

UNINTENDED EQUIPMENT OPERATION

- If OrM is set to auto, the direction will be chosen by the drive whatever the direction requested.
- Check this configuration is compatible with the application.

Failure to follow these instructions can result in equipment damage.

The power requested by the drive during evacuation phase depends on the car load, as shown on the figure below:

The requested emergency power supply [Calc. rescue power] (PMC) calculated for the ATV LIFT takes into account the chosen [Opt. rescue mode] (OrM), the dedicated parameters for evacuation and the parameters of the lift system (motor data, and lift data). This is the maximum peak power value in KVA necessary for evacuation phase according to the drive parameters.

In order to reduce the emergency power supply size, set [Opt. rescue mode] (OrM) to [Automatic] (AUtO).

If [Opt. rescue mode] (OrM) is set to [Manual] (MAnU), [Calc. rescue power] (PMC) includes the possibility to go in the less efficient direction

[1.1 LIFT] (LIF-)

The size of the emergency power supply could be optimized by adjusting following paramters:

- 1) Reduce [Cust. rescue speed] (OrSP)
- 2) Increase [Acc. time rescue] (rACC)

Note: [Acc. time rescue] (rACC) is automatically recalculated each time [Cust. rescue speed] (OrSP) is modified.

- 3) Reduce [Resc max current] (rCLI) within the limit of the application requested current.

▲ WARNING

LOSS OF CONTROL

[Resc max current] (rCLI) should be set up in order to be able to maintain the cabin during starting or run.

- If [Opt. rescue mode] (OrM) is set to [Automatic] (AUtO), [Resc max current] (rCLI) should not be much lower (75%) than the nominal current of the motor.
- If [Opt. rescue mode] (OrM) is set to [Manual] (MAnU), [Resc max current] (rCLI) should not be lower than the nominal current of the motor.

Failure to follow these instructions can result in equipment damage.

The power available with the emergency power supply depends on the runtime needed.

As lift applications does not require a long runtime in rescue mode, and based on the fact that Uninterruptible Power Supply (UPS) systems have a high crest factor, a small emergency power supply could be enough to drive the ATV LIFT up to next floor at low speed.

The available peak power available with an UPS is given by the formula below:

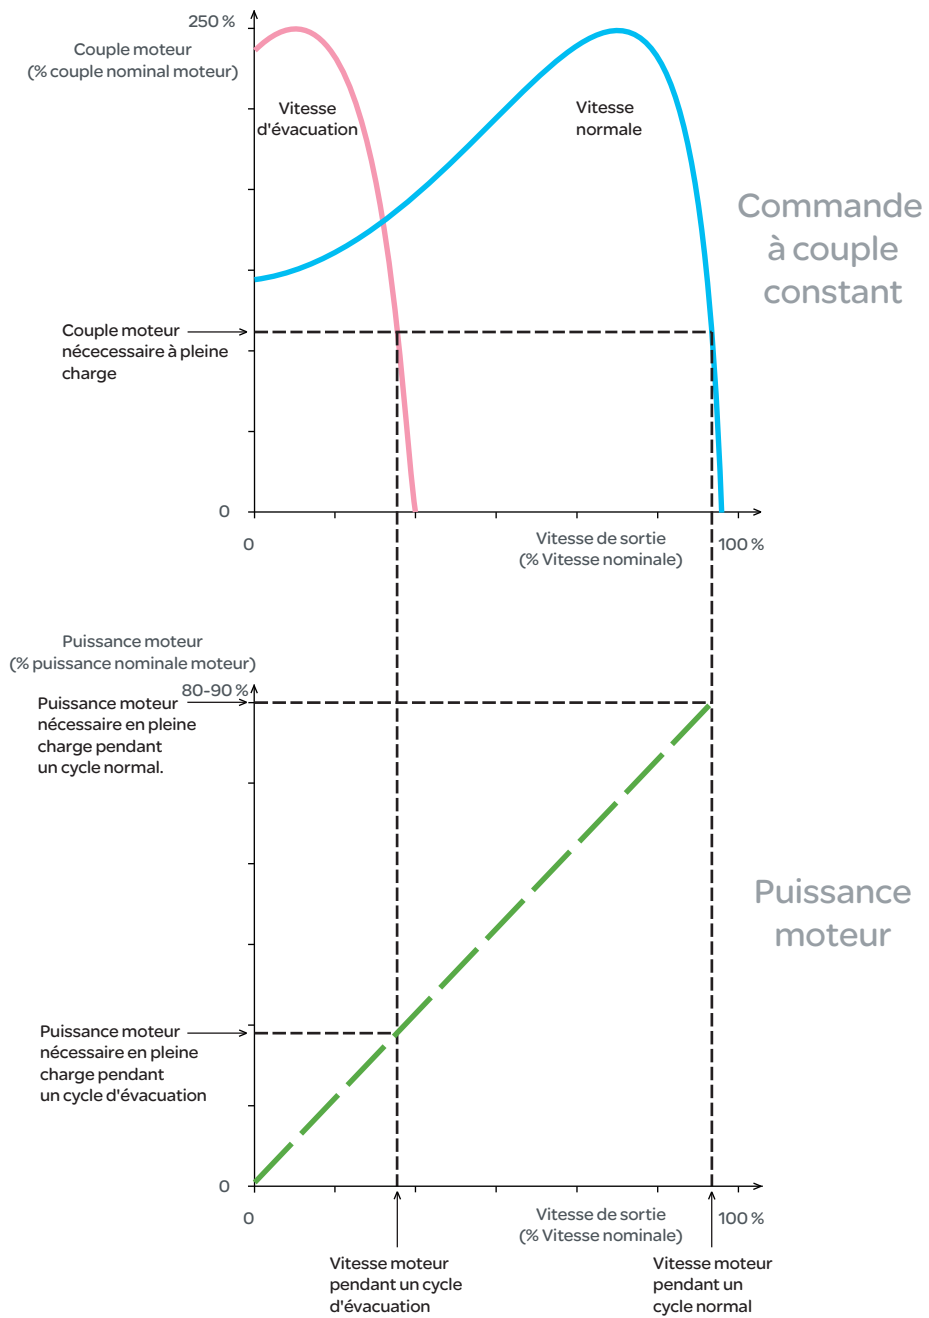

$$\text{Peak Output Capacity} = \text{Nominal Output Capacity} * \text{Crest Factor}$$

The requested electrical power depends on the torque and the speed set points following the formula:

$$\text{Power} = \text{Torque} * \text{Speed}$$

The variable speed drive allows running at constant nominal torque, so the requested electrical power depends on the speed set point. As soon as the maximum evacuation speed is low enough, even a small UPS will provide enough current to drive the motor at full torque.

() Parameter that can be modified during operation or when stopped.

[1.1 LIFT] (LIF-)

Half floor

When a lift sets off from floors and half floors, the cycle time for half floors can be too long, as the elevator does not have time to reach full speed before crossing the slowdown limit switch. As a result, the slowdown time is unnecessarily long. The "half floor" function can be used to compensate this phenomenon.

When the former ramp is used

The "half floor" function can be used to compensate this by not triggering slowdown until the speed reaches a preset threshold [Half-floor speed] (HLS) in order that the final part of the path will be the same as for a standard floor.

When the new ramp is used

If the [Lift speed mgt.] (LSM) function is assigned, the "half-floor" function is automatically:

- activated if the high speed reference is lost before the lift has reached its [Lift top speed] (LtS)
- configured according to the distance still to be covered [Deceleration length] (dEL) when the high speed reference is lost.

If the [Lift Speed Mgt] (LSM) function is not assigned, the "half-floor" function must be configured with the target speed to be reached by the lift before it starts to decelerate.

The graphs below show the various types of operation with an without the function for using the former ramp:

A: Slowdown limit switch reached
B: Stop limit switch reached

The function is only activated if, when the slowdown limit switch is tripped, the motor frequency is less than [Half-floor speed] (HLS). Acceleration is then maintained up to this value prior to slowing down. The final part of the path is identical to that of the standard floor.

[1.1 LIFT] (LIF-)

Deferred stop on thermal alarm

This function helps to prevent the lift stopping between two floors if the drive or motor overheats, by authorizing operation until the next stop. At the next stop, the drive is locked until the thermal state falls back to a value, which undershoots the set threshold by 20%. E.g. A trip threshold set at 80% enables reactivation at 64%.

One thermal state threshold must be defined for the drive, and one thermal state threshold for the motor(s), which will trip the deferred stop.

Encoder selection guide

Introduction

An encoder must be used with a synchronous motor for nominal operation.

The encoder is generally selected by the motor manufacturer. However, the ATV LIFT allows the following encoders to be used:

- Incremental
- SinCos
- SinCos Hiperface
- EnDat SinCos
- SSI
- Resolver
- Absolute SinCos

With an asynchronous motor, the use of an encoder is not mandatory. Everything depends on the performance required by the lift manufacturer.

The use of an encoder is recommended for

- High car speeds (more than 1.5 m/s)
- Highly reversible machines
- Systems where precise stopping is required
- Greater comfort when the brake is released and applied

Selection criteria

Where the drive is concerned, the selection criteria for the encoder are

Immunity to EMC interference

- Analog transmission encoders (resolver, SinCos, incremental, SinCos Hiperface) are sensitive to EMC interference.
- Digital transmission encoders (SSI, EnDat) are more robust.

Absolute/relative

An absolute encoder has an image of the position of the rotor, whereas a relative encoder only has information on the rotor speed.

With a synchronous motor, an angle test has to be performed on each power-up with the relative encoder, whereas an absolute encoder requires only one angle test on the first power-up.

Resolution

Depending on the encoder technology, the drive can "interpolate" the encoder signals to obtain a better speed resolution than that indicated by the encoder.

Examples include

- With a 4096 line (2^{12}) incremental encoder, the drive can have a resolution 4 times more accurate, in other words 16 384 points (2^{14}).
- With a SinCos encoder having the same resolution (4096 lines, (2^{12})), the drive can have a resolution 1000 times more accurate, in other words 4 194 304 points (2^{22}).

The encoder resolution has a direct effect on rollback management. Depending on the desired comfort level, an encoder with more or less precision can be used.

The following data are given for guidance. Comfort depends on many parameters (type of block and tackle, mechanism, nominal speed, reversibility of the machine, type of brake, use of an external weight sensor, etc.).

[1.1 LIFT] (LIF-)

Encoder selection guide (continued)

However, it is considered that at least 16 bits of useful resolution for the drive (the green range) are necessary for an acceptable comfort level in various loading conditions without using an external weight sensor. Below this value, discomfort may be felt.

Speed							
	3 m/s	Medium resolution required	High resolution required	High resolution required			
	1 m/s	Low resolution sufficient	Medium resolution required	Medium resolution required

high resolution	22	4194304	22	4194304	22	4194304	16	65536	

Encoder selection guide (continued)

Summary

The table below summarizes the main criteria for the selection of an encoder:

Encoder	Transmission type	Absolute/relative	Typical resolution
Incremental	Analog	Relative	8192 units
Resolver	Analog	Absolute	8 poles
SinCos / Absolute SinCos	Analog	Relative	2048 lines
SinCos Hiperface	Analog + digital on power-up	Absolute	–
SinCosEnDat	Digital + analog	Absolute	Endat 13 bit with SinCos 1024 line
EnDat	Digital	Absolute	Endat 13 bit
SSI	Digital	Absolute	–

Operation without an encoder

The ATV LIFT provides for open-loop operation with a synchronous motor, which can be used in degraded mode.

This configuration can be used for:

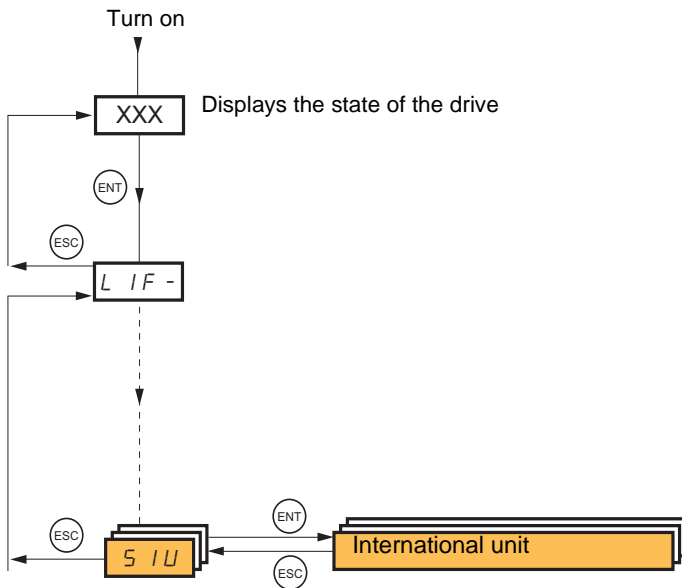

- Performing the encoder test
- Evacuating persons if the encoder is inoperable

However, the brake sequence is not compatible with open-loop operation with a synchronous motor. Stopping is therefore carried out in freewheel or ramp mode, as in the inspection mode.

[1.1 LIFT] (LIF-)

[International unit] (SIU)

With integrated display terminal:

The unit for all the followings parameters should be selected via the [\[International unit\] \(SIU\)](#) parameter.

Code	Name/Description	Factory setting
SIU	<input type="checkbox"/> [International unit]	YES
YES nO	<ul style="list-style-type: none"> • [YES] (YES): Use metric system. • [No] (nO): Use imperial units. <p>Press and hold down the "ENT" key for 2 s for the change to be taken into account.</p>	

Note 1: The first time the drive is powered up, this parameter is at the first place of the [\[1.1 LIFT\] \(LIF-\)](#) menu. It moves at the end of this menu at subsequent power ups

Note 2: Choose the [\[International unit\] \(SIU\)](#) parameter value before starting the parameters adjustment of the drive.

Note 3: NPR unit does not depend on [\[International unit\] \(SIU\)](#) parameter, it depends on [\[Standard mot. freq\] \(bFr\)](#) parameter. See page [146](#)

⚠ WARNING

LOSS OF CONTROL

- Before to transfert a configuration to the drive with a commissioning tool, set the [\[International unit\] \(SIU\)](#) parameter of the drive to the same value as in the configuration to transfert to the drive.
- Do not transfert a configuration with [\[International unit\] \(SIU\)](#) set to **[No] (nO)** into a drive where this parameter does not exist (Drive version < 5.4).
- [\[International unit\] \(SIU\)](#) will changes unit for setting. Check that this change is compatible with the application.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

[1.1 LIFT] (LIF-)

WARNING

LOSS OF CONTROL

- For parameter JAPL, JCAL, JMOT, LCA, CMA and CTM, the maximum value is reduced in Imperial units compare to International metric units.
- Choose the [International unit] (SIU) parameter value before starting the parameters adjustment of the drive.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

(1) The high limit could be overflowed during the conversion when changing [International unit] (SIU) from [Yes] (yES) to [No] (nO) . The display will show the maximum value, but internally, the right value is kept in order not to change the behaviour of the application just when changing [International unit] (SIU). If the concerned parameter is changed manually, the new value is taken into account after validation.

[1.2 MONITORING] (SUP-)

With graphic display terminal: Drive internal states and values

Name/Description	
[Alarm groups] (ALGr)	Current alarm group numbers
[HMI Frequency ref.] (LFr)	in Hz. Frequency reference via the graphic display terminal (can be accessed if the function has been configured).
[HMI torque ref.] (Ltr)	as a % of the rated torque. Torque reference via graphic display terminal.
[Multiplying coeff.] (MFr)	as a % (can be accessed if [Multiplier ref. -] (MA2,MA3) page 223 has been assigned)
[Frequency ref.] (FrH)	in Hz
[Torque reference] (trr)	as a % of the rated torque (can be accessed if the function has been configured)
[Output frequency] (rFr)	in Hz
[Measured output fr.] (MMF)	in Hz: The measured motor speed is displayed if an encoder card has been inserted, otherwise 0 appears.
[Pulse in. work. freq.] (FqS)	in Hz: Frequency of the "Pulse input" input used by the [FREQUENCY METER] (FqF-) function, page 287.
[Motor current] (LCr)	in A
[Lift speed] (ESP)	in m/s
[Motor speed] (SPd)	in rpm
[Motor voltage] (UOP)	in V
[Motor power] (OPr)	as a % of the rated power
[Motor torque] (Otr)	as a % of the rated torque
[Mains voltage] (ULn)	in V. Line voltage from the point of view of the DC bus, motor running or stopped.
[Travel distance] (dOt)	in km
[Number of travels] (nOt)	Number of travels in thousands
[Motor thermal state] (tHr)	as a %
[Drv.thermal state] (tHd)	as a %
[DBR thermal state] (tHb)	as a % (can be accessed if [DB res. protection] (brO) has been enabled, see page 288)
[Consumption] (APH)	in Wh, kWh or MWh (accumulated consumption)
[Run time] (rtH)	in seconds, minutes or hours (length of time the motor has been switched on)
[Power on time] (PtH)	in seconds, minutes or hours (length of time the drive has been switched on)
[IGBT alarm counter] (tAC)	in seconds (length of time the "IGBT temperature" alarm has been active)
[IGBT alarm Nb] (ntJ)	number of time the switching frequency has been decrease to reduce the power module temperature (can be accessed in expert mode only)
[Calc. rescue power] (PMC)	in VA, UPS requested power (can be accessed if [Evacuation assign.] (rFt) is not set to [No] (no) and [Opt. rescue mode] (OrM) is not set to [Standard] (Std)).
[- - - -] (o02)	Words generated by the Controller Inside card (can be accessed if the card has been inserted)
to	
[- - - -] (o06)	
	Active configuration [Config. n°0, 1 or 2]
[Config. active] (CnFS)	[Set n°1, 2 or 3] (can be accessed if parameter switching has been enabled, see page 259)
[Utilised param. set] (CFPS)	List of current alarms. If an alarm is present, a ✓ appears.
[ALARMS] (ALr-)	List of secondary states:
[OTHER STATE] (SSt-)	
	<ul style="list-style-type: none"> - [In motor fluxing] (FLX): In motor fluxing - [PTC1 alarm] (PtC1): Probe alarm 1 - [PTC2 alarm] (PtC2): Probe alarm 2 - [LI6=PTC alarm] (PtC3): LI6 = PTC probe alarm - [Fast stop in prog.] (FSt): Fast stop in progress - [Current Th. attained] (CtA): Current threshold attained ([Current threshold] (Ctd) page 143) - [Freq. Th. attained] (FtA): Frequency threshold attained ([Freq. threshold] (Ftd) page 144) - [Freq. Th. 2 attained] (F2A): 2nd frequency threshold attained ([Freq. threshold 2] (F2d) page 144) - [Frequency ref. att.] (SrA): Frequency reference attained - [Motor th. state att.] (tSA): Motor 1 thermal state attained - [External fault alarm] (EtF): External fault alarm - [Auto restart] (AUtO): Automatic restart in progress - [Remote] (FtL): Line mode control - [Auto-tuning] (tUn): Performing auto-tuning - [Undervoltage] (USA): Undervoltage alarm - [Cnfg.1 act.] (CnF1): Configuration 1 active - [Cnfg.2 act.] (CnF2): Configuration 2 active
	<ul style="list-style-type: none"> - [HSP attained] (FLA): High speed attained - [Load slipping] (AnA): Slipping alarm - [set 1 active] (CFP1): Parameter set 1 active - [set 2 active] (CFP2): Parameter set 2 active - [set 3 active] (CFP3): Parameter set 3 active - [In braking] (brS): Drive braking - [DC bus loading] (dbL): DC bus charging - [Forward] (MFrd): Motor running forward - [Reverse] (MrrS): Motor running in reverse - [High torque alarm] (ttHA): Motor torque higher than high threshold [High torque thd.] (ttH) page 143. - [Low torque alarm] (ttLA): Motor torque less than low threshold [Low torque thd.] (ttL) page 143. - [Freq. meter Alarm] (FqLA): Measured speed threshold attained: [Pulse warning thd.] (FqL) page 144.

[1.2 MONITORING] (SUP-)

With integrated display terminal

This menu can be used to display the drive inputs, states and internal values.

With integrated display terminal:

[1.3 SETTINGS] (SEt-)

The adjustment parameters can be modified with the drive running or stopped.

⚠ DANGER

UNINTENDED EQUIPMENT OPERATION

- Check that changes made to the settings during operation do not present any danger.
- We recommend stopping the drive before making any changes.

Failure to follow these instructions will result in death or serious injury.

Code	Name/Description	Adjustment range	Factory setting
<i>Inr</i> <i>0.01</i> <i>0.1</i> <i>1</i>	<input type="checkbox"/> [Ramp increment] <input type="checkbox"/> [0.01] : Ramp up to 99.99 seconds <input type="checkbox"/> [0.1] : Ramp up to 999.9 seconds <input type="checkbox"/> [1] : Ramp up to 6000 seconds This parameter is valid for [Acceleration] (ACC) , [Deceleration] (dEC) , [Acceleration 2] (AC2) and [Deceleration 2] (dE2) .	0.01 - 0.1 - 1	0.1
<i>ACC</i>	<input type="checkbox"/> [Acceleration] Time to accelerate from 0 to the [Rated motor freq.] (FrS) page 152 for an asynchronous motor or [Nominal freq sync.] (FrSS) page 158 for a synchronous motor. Make sure that this value is compatible with the inertia being driven.	0.01 to 6000 s (1)	3.0 s
<i>dEC</i>	<input type="checkbox"/> [Deceleration] Time to decelerate from the [Rated motor freq.] (FrS) page 152 to 0 for an asynchronous motor or [Nominal freq sync.] (FrSS) page 158 for a synchronous motor. Make sure that this value is compatible with the inertia being driven.	0.01 to 6000 s (1)	3.0 s
<i>AC2</i> ★	<input type="checkbox"/> [Acceleration 2] See page 226 Time to accelerate from 0 to the [Rated motor freq.] (FrS) page 152 for an asynchronous motor or [Nominal freq sync.] (FrSS) page 158 for a synchronous motor. <i>dE2</i> ★	<input type="checkbox"/> [Deceleration 2] See page 226 Time to decelerate from the [Rated motor freq.] (FrS) page 152 to 0 for an asynchronous motor or [Nominal freq sync.] (FrSS) page 158 for a synchronous motor. Make sure that this value is compatible with the inertia being driven.	0.01 to 6000 s (1)	5.0 s
<i>tA1</i> ★	<input type="checkbox"/> [Begin Acc round] See page 225 Rounding of start of acceleration ramp as a % of the [Acceleration] (ACC) or [Acceleration 2] (AC2) ramp time.	0 to 100 %	50 %
<i>tA2</i> ★	<input type="checkbox"/> [End Acc round] See page 225 - Rounding of end of acceleration ramp as a % of the [Acceleration] (ACC) or [Acceleration 2] (AC2) ramp time. - Can be set between 0 and (100% - [Begin Acc round] (tA1))		50 %
<i>tA3</i> ★	<input type="checkbox"/> [Begin Dec round] See page 225 Rounding of start of deceleration ramp as a % of the [Deceleration] (dEC) or [Deceleration 2] (dE2) ramp time.	0 to 100 %	40 %

(1) Range 0.01 to 99.99 s or 0.1 to 999.9 s or 1 to 6000 s according to **[Ramp increment] (Inr)**.

★ These parameters only appear if the corresponding function has been selected in another menu. When the parameters can also be accessed and adjusted from within the configuration menu for the corresponding function, their description is detailed in these menus, on the pages indicated, to aid programming.

[1.3 SETTINGS] (SEt-)

Code	Name/Description	Adjustment range	Factory setting
LEH ★	<input type="checkbox"/> [End Dec round] See page 225 - Rounding of end of deceleration ramp as a % of the [Deceleration] (dEC) or [Deceleration 2] (dE2) ramp time. - Can be set between 0 and (100% - [Begin Dec round] (tA3)).		60 %
LSP	<input type="checkbox"/> [Low speed] Motor frequency at minimum reference, can be set between 0 and [High speed] (HSP).		0 Hz
HSP	<input type="checkbox"/> [High speed] Motor frequency at maximum reference, can be set between [Low speed] (LSP) and [Max frequency] (tFr). The factory setting changes to 60 Hz if [Standard mot. freq] (bFr) = [60Hz NEMA] (60).		50 Hz
CAUTION RISK OF DAMAGE TO THE EQUIPMENT For permanent magnet synchronous motors, the maximum permissible speed must not be exceeded, otherwise demagnetization may occur. The maximum speed permitted by the motor, drive chain or application must not be exceeded at any time. Failure to follow these instructions can result in equipment damage.			
LEH	<input type="checkbox"/> [Mot. therm. current] Motor thermal protection current, to be set to the rated current indicated on the motor nameplate page 274	0.2 to 1.5 In (1)	According to drive rating
SFC ()	<input type="checkbox"/> [K speed loop filter] Speed loop filter coefficient. See page 69 for more details of the effect of this parameter.	0 to 100	According to [Motor control type] (Ct)
SLEA ()	<input type="checkbox"/> [Fr.Loop.Stab] Stability: Used to adapt the return to steady state after a speed transient, according to the dynamics of the machine. Gradually increase the stability to increase control loop attenuation and thus reduce any overspeed. See page 69 for more details of the effect of this parameter.	0 to 100 %	20 %
FLG ()	<input type="checkbox"/> [FreqLoopGain] Frequency loop gain: Used to adapt the pace of the machine speed transients according to the dynamics. Gradually increase the gain to increase the control loop passband. See page 69 for more details of the effect of this parameter. [FreqLoopGain] (FLG) is set to 20% when [Motor control type] (Ct) is set to [Sync. mot.] (SYn) or (FSY).	0 to 100 %	According to [Motor control type] (Ct)

(1) In corresponds to the rated drive current indicated in the Installation Manual or on the drive nameplate.

 Parameter that can be modified during operation or when stopped.

 Parameter that can be modified during operation or when stopped.

[1.4 MOTOR CONTROL] (drC-)

Selecting the encoder

Follow the recommendations in the catalog and the Installation Manual.

Note 1: When an encoder is used with a VW3 A3 408 or VW3 A3 409 card, it is only possible to configure the "encoder" input for speed feedback. Functions can only be configured as references or inputs with a VW3 A3 401 to 407 and VW3 A3 411 card.

Note 2: When an encoder is used with a VW3 A3 409 card, the drive remains locked in stop mode (and displays nSt or nLp) if the encoder is not fully configured.

Encoder check procedure

This procedure applies to all types of encoder.

1. Configure the parameters of the encoder used, pages [186](#) to [189](#).
2. Set [\[Motor control type\] \(Ctt\)](#) to a value other than [\[FVC\] \(FUC\)](#) and [\[Sync.CL\] \(FSY\)](#), even if it is the required configuration. For example, use [\[SVC V\] \(UUC\)](#) for an asynchronous motor and [\[Sync. mot.\] \(SYn\)](#) for a synchronous motor.
3. Configure the motor parameters in accordance with the specifications on the rating plate.
 - Asynchronous motor (see page [152](#)): [\[Rated motor power\] \(nPr\)](#), [\[Rated motor volt.\] \(UnS\)](#), [\[Rated mot. current\] \(nCr\)](#), [\[Rated motor freq.\] \(FrS\)](#), [\[Rated motor speed\] \(nSP\)](#).
 - Synchronous motor (see page [157](#)): [\[Nominal I sync\] \(nCrS\)](#), [\[Nom motor spdsync\] \(nSPS\)](#), [\[Pole pairs.\] \(PPnS\)](#), [\[Syn. EMF constant\] \(PHS\)](#), [\[Autotune L d-axis\] \(LdS\)](#), [\[IAutotune L q-axis\] \(LqS\)](#), [\[Cust. stator R syn\] \(rSAS\)](#). [\[Current limitation\] \(CLI\)](#) must not exceed the maximum motor current, **otherwise demagnetization may occur**.
4. Set [\[Encoder usage\] \(EnU\)](#) = [\[No\] \(nO\)](#).
5. Perform auto-tuning.
6. Set [\[Encoder check\] \(EnC\)](#) = [\[Yes\] \(YES\)](#).
7. Set the motor rotating at stabilized speed $\approx 15\%$ of the rated speed for at least 3 seconds, and use the [\[1.2-MONITORING\] \(SUP-\)](#) menu to monitor its behavior.
8. If it trips on an [\[Encoder fault\] \(EnF\)](#), [\[Encoder check\] \(EnC\)](#) returns to [\[No\] \(nO\)](#).
 - Check the parameter settings and perform auto-tuning again (see steps 1 to 5 above).
 - Check that the mechanical and electrical operation of the encoder, its power supply and connections are OK.
 - Reverse the direction of rotation of the motor ([\[Output Ph rotation\] \(PHr\)](#) parameter page [147](#)) or the encoder signals.
9. Repeat the operations from step 6 onwards until [\[Encoder check\] \(EnC\)](#) changes to [\[Done\] \(dOnE\)](#).
10. If necessary, change [\[Motor control type\] \(Ctt\)](#) to [\[FVC\] \(FUC\)](#) or [\[Sync.CL\] \(FSY\)](#). In the case of [\[Sync.CL\] \(FSY\)](#), go on to perform the "Procedure for measuring the phase-shift angle between the motor and the encoder" page [159](#).

[1.4 MOTOR CONTROL] (drC-)

Code	Name/Description	Adjustment range	Factory setting
EnS-	[ENCODER FEEDBACK] Can only be accessed if an encoder card has been inserted.		
EnC nD YES dOnE	<input type="checkbox"/> [Encoder check] Check encoder feedback. See procedure on previous page. This parameter can be accessed if an encoder card has been inserted (1). <input type="checkbox"/> [Not done] (nO) : Check not performed. <input type="checkbox"/> [Yes] (YES) : Activates monitoring of the encoder. <input type="checkbox"/> [Done] (dOnE) : Check performed successfully. The check procedure checks: <ul style="list-style-type: none"> - The direction of rotation of the encoder/motor - The presence of signals (wiring continuity) - The number of pulses/revolution If a fault is detected, the drive locks in [Encoder fault] (EnF) fault mode.		[Not done] (nO)
EnU nD SEC rEG PGr COr	<input type="checkbox"/> [Encoder usage] This parameter can be accessed if an encoder card has been inserted (1). <input type="checkbox"/> [No] (nO) : Function inactive. <input type="checkbox"/> [Fdbk monit.] (SEC) : The encoder provides speed feedback for monitoring only. <input type="checkbox"/> [Spd fdk reg.] (rEG) : The encoder provides speed feedback for regulation and monitoring. This configuration is automatic if the drive is configured for closed-loop operation ([Motor control type] (Ctt) = [FVC] (FUC) or [Sync.CL] (FSY)). If [Motor control type] (Ctt) = [SVC V] (UUC) the encoder operates in speed feedback mode and enables static correction of the speed to be performed. This configuration is not accessible for other [Motor control type] (Ctt) values. <input type="checkbox"/> [Speed ref.] (PGr) : The encoder provides a reference. Can only be selected with an incremental encoder card. <input type="checkbox"/> [Slip Comp.] (COr) : The encoder provides speed feedback for speed correction and monitoring. This configuration is accessible if [Motor control type] (Ctt) is set to [Sync.CL] (FSY) . The encoder enables a dynamic and static correction of the speed. This choice could be used in case of random error on the encoder feedback (encoder slipping at high speed for example). The less the encoder feedback is reliable, the more the drive will work as in open-loop operation.		[No] (nO)

(1) The encoder parameters can only be accessed if the encoder card has been inserted, and the available selections will depend on the type of encoder card used. The encoder configuration can also be accessed in the **[1.5 - INPUTS / OUTPUTS CFG] (I/O)** menu.

[1.4 MOTOR CONTROL] (drC-)

Asynchronous motor parameters:

These parameters can be accessed if [Motor control type] (Ctt) page 146 = [SVC V] (UUC), [SVC I] (CUC), [FVC] (FUC), [V/F 2pts] (UF2) or [V/F 5pts] (UF5). In this case, the synchronous motor parameters cannot be accessed.

Code	Name/Description	Adjustment range
AS4-	[ASYNC. MOTOR] Can only be accessed if [Motor control type] (Ctt) page 146 = [SVC V] (UUC), [SVC I] (CUC), [FVC] (FUC), [V/F 2pts] (UF2), or [V/F 5pts] (UF5).	
nPr	<input type="checkbox"/> [Rated motor power] Rated motor power given on the nameplate, in kW if [Standard mot. freq] (bFr) = [50Hz IEC] (50), in HP if [Standard mot. freq] (bFr) = [60Hz NEMA] (60).	Acc. to drive rating
Un5	<input type="checkbox"/> [Rated motor volt.] Rated motor voltage given on the nameplate. ATV71L●●●M3XZ: 100 to 240 V, ATV71L●●●N4Z: 200 to 480 V	Acc. to drive rating
nCr	<input type="checkbox"/> [Rated mot. current] Rated motor current given on the nameplate.	0.25 to 1.5 In (1)
Fr5	<input type="checkbox"/> [Rated motor freq.] Rated motor frequency given on the nameplate. The factory setting is 50 Hz, or preset to 60 Hz if [Standard mot. freq] (bFr) is set to 60 Hz. The maximum value is limited to 500 Hz if [Motor control type] (Ctt) (page 146) is not V/F. Values between 500 Hz and 1600 Hz are only possible in V/F control. In this case, configure [Motor control type] (Ctt) before [Rated motor freq.] (FrS).	10 to 1600 Hz
InSP I ID	<input type="checkbox"/> [rpm increment] Increment of parameter [Rated motor speed] (nSP). <input type="checkbox"/> [x1 rpm] (1): Increment of 1 rpm, to be used if [Rated motor speed] (nSP) does not exceed 65535 rpm. <input type="checkbox"/> [x10 rpm] (10): Increment of 10 rpm, to be used if [Rated motor speed] (nSP) exceeds 65535 rpm.  Note: Changing [rpm increment] (InSP) will restore [Rated motor speed] (nSP) to its factory setting.	
nSP	<input type="checkbox"/> [Rated motor speed] Rated motor speed given on the nameplate. Adjustable between 0 and 65535 rpm if [rpm increment] (InSP) = [x1 rpm] (1) or between 0.00 and 96.00 krpm if [rpm increment] (InSP) = [x10 rpm] (10). 0 to 9999 rpm then 10.00 to 65.53 or 96.00 krpm on the integrated display terminal. If, rather than the rated speed, the nameplate indicates the synchronous speed and the slip in Hz or as a %, calculate the rated speed as follows: <ul style="list-style-type: none"> • Rated speed = Synchronous speed x $\frac{100 - \text{slip as a \%}}{100}$ or • Rated speed = Synchronous speed x $\frac{50 - \text{slip in Hz}}{50}$ (50 Hz motors) or • Rated speed = Synchronous speed x $\frac{60 - \text{slip in Hz}}{60}$ (60 Hz motors) 	0 to 96000 rpm

(1) In corresponds to the rated drive current indicated in the Installation Manual and on the drive nameplate.

() Parameter that can be modified during operation or when stopped.

[1.4 MOTOR CONTROL] (drC-)

Asynchronous motor parameters that can be accessed in [Expert] mode

These include:

- Special parameters.
- Parameters calculated by the drive during auto-tuning, in read-only mode. For example, [Stator R measured] (rSM), calculated cold stator resistance.
- The possibility of replacing some of these calculated parameters with other values, if necessary. For example, [Cust stator resist.] (rSA), measured cold stator resistance.

When a parameter is modified by the user, the drive uses it in place of the calculated parameter.

If auto-tuning is performed or if one of the motor parameters on which auto-tuning depends is modified ([Rated motor volt.] (UnS), [Rated motor freq.] (FrS), [Rated mot. current] (nCr), [Rated motor speed] (nSP), [Rated motor power] (nPr)), the modified parameters return to their factory setting.

Code	Name/Description	Adjustment range	Factory setting
ASY-	[ASYNC. MOTOR] (continued)		
r5n	<input type="checkbox"/> [Stator R measured] Cold stator resistance, calculated by the drive, in read-only mode. Value in milliohms (mΩ) up to 75 kW (100 HP), and in hundredths of milliohms (mΩ/100) above 75 kW (100 HP).		
ldr	<input type="checkbox"/> [ldr] Magnetizing current in A, calculated by the drive, in read-only mode.		
Lfn	<input type="checkbox"/> [Lfr] Leakage inductance in mH, calculated by the drive, in read-only mode.

Parameter that can be modified during operation or when stopped.

[1.4 MOTOR CONTROL] (drC-)

Closed-loop synchronous motor

Operation on a synchronous motor in a closed loop configuration requires an encoder providing the exact position of the motor rotor. The phase-shift angle of the encoder in relation to the rotor must therefore be determined. The drive can perform this measurement automatically.

Selecting a resolver type encoder

If the number of motor poles is not a whole multiple of the number of resolver poles, the resolver is a relative encoder and no longer absolute. You should therefore set the [Angle setting activ.] (AtA) parameter = [Power On] (POn) or [Run order] (AUtO).

Procedure for measuring the phase-shift angle between the motor and the encoder

Preliminary remarks:

Select the [Angle setting type] (ASt) measuring mode according to the type of machine being driven:

- [Angle setting type] (ASt) = [W/o load] (nLd): Measurement with motion, if the rotation of the motor is free (no load, brake released) During measurement current flows through the motor, which may cause it to rotate one full revolution.

⚠ DANGER
UNINTENDED EQUIPMENT OPERATION
Check that the rotation of the motor will not cause any dangerous movements.
Failure to follow this instruction can result in death or serious injury.

- [Angle setting type] (ASt) = [With load] (brC): Measurement without motion, motor with or without load, brake engaged or released. This mode is recommended for a lift, for example. **You must adhere to the following instructions:**
 - The motor rotor must not move during measurement, otherwise the result will be incorrect.
 - In some cases, the measurement current can cause tripping on an [Overcurrent] (OCF) fault; if so, use [W/o load] (nLd) mode. This occurs when using low-inductance motors, high-speed motors, or motors in which the rated voltage is well below the supply voltage of the drive.
 - In some cases, the measurement can cause tripping on an [Angle error] (ASF) fault. This occurs if the motor rotor has moved during measurement (only detected in closed-loop mode), a motor phase is disconnected or if the motor inductance is too high, thus limiting the measurement current (in this case, use [W/o load] (nLd) mode).
 - [Angle setting type] (ASt) = [Optimised] (brCO): Measurement without motion, possible with or without load, brake engaged or released. Optimizing the angle detection time, based on the second detection request, even after the product has been turned off.
1. First, follow the "Encoder check procedure" on page [150](#).
 2. Set [Motor control type] (Ctt) = [Sync.CL] (FSY).
 3. If you have selected [Angle setting type] (ASt) = [W/o load] (nLd): For measurement with motion, check that the motor can turn freely **without resistive or driving torque. If this condition is not met, the resulting measurement will be inaccurate.**
 4. Set [Angle auto-test] (ASA) = [Yes] (YES). The measurement is performed and [Angle auto-test] (ASA) changes to [Done] (dOnE). The [Angle offset value] (ASU) parameter changes from [No] (nO) to a numerical value proportional to the electrical angle measured (8191 = 360°).
 5. If required, configure automatic measurements using [Angle setting activ.] (AtA). If using a relative encoder (incremental or SinCos), it is recommended that you set [Angle setting activ.] (AtA) = [Power On] (POn) or [Run order] (AUtO).
 6. If an [Angle error] (ASF) fault occurs, [Angle auto-test] (ASA) returns to [No] (nO).
 - Check that the parameters and instructions relating to this procedure have been carried out correctly and perform the measurement again.

Notes

The phase-shift angle must be re-measured each time:

- The motor is changed
- The encoder is changed
- The coupling between the motor and encoder is removed
- The [Output Ph rotation] (PHr) parameter is modified
- The [Coder rotation inv.] (EnRI) parameter is modified.

If a relative encoder (incremental or SinCos) is used, measurement must be repeated each time the motor is turned off/on. It is therefore recommended that you set [Angle setting activ.] (AtA) = [Power On] (POn) or [Run order] (AUtO).

(1) Powering down causes a loss of measurement data in the following cases:

- With a VW3 A3 401 to 407 and VW3 A3 411 card:
 - Every time the power section is turned off, even if the drive control section has a separate power supply (for example, if the "line contactor" function has been configured).
- With a VW3 A3 409 card and a SinCos encoder:
 - Every time the power section is turned off, if the drive control section does not have a separate power supply.
 - Only when the drive control section is turned off (if it has a separate power supply via the 0 and P24 terminals).
 - If the resolver has a number of poles which is not a multiple of the number of motor poles.
- With a VW3 A3 410 card:
 - VW3 A3 410 card manage SinCos encoders providing signal for the mechanical position of the rotor (if wired) in addition of standard sincos signals of the speed feedback.
 - This mechanical position information is useful with synchronous motor (PMSM) because no more angle test is required at power on (just one is needed at the installation as the absolute encoder).

[1.4 MOTOR CONTROL] (drC-)

[ENA SYSTEM]

ENA SYSTEM is a control profile designed for rotating machines with unbalanced load. **It only applies to asynchronous motors.**

It is used primarily for oil pumps. The operating principle applied:

- Allows operation without a braking resistor
- Reduces mechanical stress on the rod
- Reduces line current fluctuations
- Reduces energy consumption by improving the electric power/current ratio.

[ENA prop.gain]

This setting is used to achieve a compromise between the reduced energy consumption (and/or line current fluctuations) and the mechanical stress to which the rod is subject.

Energy is saved by reducing current fluctuations and increasing the current while retaining the same average speed.

[ENA integral gain]

This setting is used to smooth the DC bus voltage.

Start up the machine with a low integral and proportional gain (proportional 25% and integral 10%) in order to avoid an overvoltage trip in the absence of a braking resistor. See if these settings are suitable.

Recommended adjustments to be made during operation:

- To be able to remove the braking resistor and, to limit the increase in the DC bus voltage:
Display the machine speed on the graphic display terminal.
Reduce the integral gain value until the machine speed drops. When this point is reached, increase the integral gain until the machine speed stabilizes.
Use the graphic display terminal or an oscilloscope to check that the DC bus voltage is stable.
- To save energy:
Reducing the proportional gain (gradually) may increase energy savings by reducing the maximum value of the line current, but it will increase speed variations and, therefore, mechanical stress.
The aim is to identify settings that will enable energy to be saved and minimize mechanical stress.
When reducing the proportional gain, it may be necessary to readjust the integral gain in order to avoid an overvoltage trip.

Note: Once the adjustments are complete, check that the pump starts up correctly. If the ENA integral gain setting is too low, this may lead to insufficient torque on startup.

[Reduction ratio]

This setting corresponds to the motor speed ahead of gearbox/speed after gearbox ratio. This parameter is used to display the average speed in Hz and the machine speed in customer units (e.g., in strokes per minute) on the graphic display terminal. In order to be displayed on the graphic display terminal, these values must be selected in the [1.2 MONITORING] (SUP-) menu.

Adjustment recommendations for prevention of tripping in [Overspeed] (SOF)

ENA SYSTEM authorizes overspeed, which can trigger an [Overspeed] (SOF) detected fault. To avoid this occurring, it is advisable to increase the value of the following parameters slightly:

- [Max frequency] (tFr) page [147](#).
- [Overspd. pulse thd.] (FqA) page [287](#), if the "frequency meter" function is configured.

SUL nO YES	<input type="checkbox"/> [Motor surge limit.] This function limits motor overvoltages and is useful in the following applications: <ul style="list-style-type: none"> - NEMA motors - Japanese motors - Spindle motors - Rewound motors <input type="checkbox"/> [No] (nO) : Function inactive <input type="checkbox"/> [Yes] (YES) : Function active This parameter is forced to [No] (nO) if [Sinus filter] (OFI) page 148 = [Yes] (YES) . This parameter can remain = [No] (nO) for 230/400 V motors used at 230 V, or if the length of cable between the drive and the motor does not exceed: <ul style="list-style-type: none"> - 4 m with unshielded cables - 10 m with shielded cables 		[No] (nO)
SOP	<input type="checkbox"/> [Volt surge limit. opt] Optimization parameter for transient overvoltages at the motor terminals. Can be accessed if [Motor surge limit.] (SUL) = [Yes] (YES) . Set to 6, 8, or 10 μ s, according to the following table.		10 μ s

The value of the "SOP" parameter corresponds to the attenuation time of the cable used. It is defined to prevent the superimposition of voltage wave reflections resulting from long cable lengths. It limits overvoltages to twice the DC bus rated voltage.

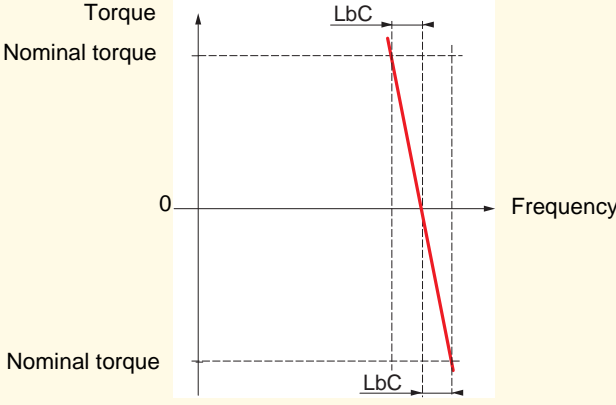

For longer cable lengths, a sinus filter or a dV/dt protection filter must be used.

- For motors in parallel, the sum of all the cable lengths must be taken into consideration. Compare the length given in the table row corresponding to the power for one motor with that corresponding to the total power, and select the shorter length. E.g. Two 7.5 kW (10 HP) motors - take the lengths on the 15 kW (20 HP) table row, which are shorter than those on the 7.5 kW (10 HP) row, and divide by the number of motors to obtain the length per motor (with unshielded "GORSE" cable and SOP = 6, the result is $40/2 = 20$ m maximum for each 7.5 kW (10 HP) motor).

In special cases (for example, different types of cable, different motor powers in parallel, different cable lengths in parallel, etc.), we recommend using an oscilloscope to check the overvoltage values obtained at the motor terminals.

To retain the overall drive performance, do not increase the SOP value unnecessarily.

Code	Name/Description	Adjustment range	Factory setting
L I -	[LI1 CONFIGURATION]		
L I R	<input type="checkbox"/> [LI1 assignment] Read-only parameter, cannot be configured. It displays all the functions that are assigned to input LI1 in order to check for multiple assignments.		
L I d	<input type="checkbox"/> [LI1 On Delay] This parameter is used to take account of the change of the logic input to state 1 with a delay that can be adjusted between 0 and 200 milliseconds, in order to filter out possible interference. The change to state 0 is taken into account without delay. Note: The relative order in which these inputs are taken into account may be modified according to the delay values of the various logic inputs, and thus lead to unintended operation.	0 to 200 ms	0
L - -	[LIx CONFIGURATION]		
	All the logic inputs available on the drive are processed as in the example for LI1 above, up to LI6, LI10 or LI14, depending on whether or not option cards have been inserted.		

Configuration of analog inputs and Pulse input

The minimum and maximum input values (in volts, mA, etc.) are converted to % in order to adapt the references to the application.

Minimum and maximum input values:

The minimum value corresponds to a reference of 0% and the maximum value to a reference of 100%. The minimum value may be greater than the maximum value:

For +/- bidirectional inputs, the min. and max. are relative to the absolute value, for example, +/- 2 to 8 V.

Negative min. value of Pulse input:

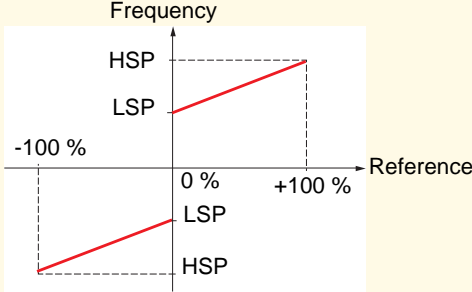

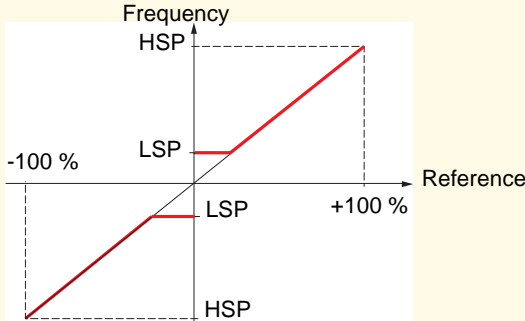

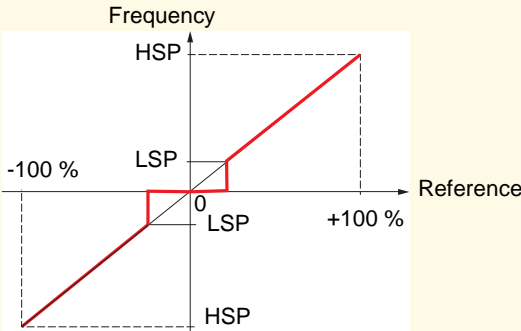

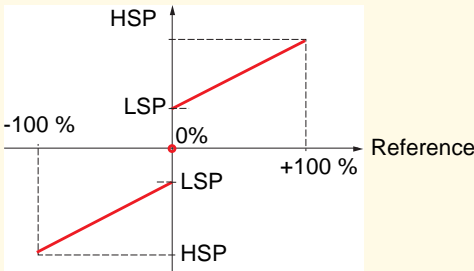

Range (output values): For analog inputs only

This parameter is used to configure the reference range to [0% → 100%] or [-100% → +100%] in order to obtain a bidirectional output from a unidirectional input.

[1.5 INPUTS / OUTPUTS CFG] (I-O-)

Code	Name/Description	Adjustment range	Factory setting
bSP	<input type="checkbox"/> [Reference template]		[Standard] (bSd)
bSd	<input type="checkbox"/> [Standard] (bSd) 	At zero reference the frequency = LSP	
bLS	<input type="checkbox"/> [Pedestal] (bLS) 	At reference = 0 to LSP the frequency = LSP	
bnS	<input type="checkbox"/> [Deadband] (bnS) 	At reference = 0 to LSP the frequency = 0	
bnS0	<input type="checkbox"/> [Deadband 0] (bnS0) 	<p>This operation is the same as [Standard] (bSd), except that in the following cases at zero reference, the frequency = 0:</p> <ul style="list-style-type: none"> • The signal is less than [Min value], which is greater than 0 (example 1 V on a 2 - 10 V input) • The signal is greater than [Min value], which is greater than [Max value] (example 11 V on a 10 - 0 V input). <p>If the input range is configured as "bidirectional", operation remains identical to [Standard] (bSd).</p>	
<p>This parameter defines how the speed reference is taken into account, for analog inputs and Pulse input only. The limits are set by the [Low speed] (LSP) and [High speed] (HSP) parameters, page 135.</p>			

[1.5 INPUTS / OUTPUTS CFG] (I-O-)

Delinearization: For analog inputs only

The input can be delinearized by configuring an intermediate point on the input/output curve of this input:

For range 0 → 100%

Note: For [Interm. point X], 0% corresponds to [Min value] and 100% to [Max value]

For range -100% → 100%

[1.5 INPUTS / OUTPUTS CFG] (I-O-)

Configuration of the encoder input serving as a reference, with a frequency generator

This reference is not signed, therefore the directions of operation must be given via the control channel (logic inputs, for example).

Minimum and maximum values (input values):

The minimum value corresponds to a minimum reference of 0% and the maximum value to a maximum reference of 100%. The minimum value may be greater than the maximum value. It may also be negative.

A reference can be obtained at zero frequency by assigning a negative value to the minimum value.

[1.5 INPUTS / OUTPUTS CFG] (I-O-)

The encoder configuration can also be accessed in the [1.4 MOTOR CONTROL] (drC-) menu.

Note 1: When an encoder is used with a VW3 A3 408 or VW3 A3 409 card, it is only possible to configure the "encoder" input for speed feedback. Functions can only be configured as references or inputs with a VW3 A3 401 to 407 and VW3 A3 411 card.

Note 2: When an encoder is used with a VW3 A3 409 card, the drive remains locked in stop mode (displays nSt or nLP) if the encoder is not fully configured.

Code	Name/Description	Adjustment range	Factory setting
IE n -	[ENCODER CONFIGURATION] The encoder parameters can only be accessed if a compatible encoder card has been inserted, and the available selections will depend on the type of encoder card used.		
EnS	<input type="checkbox"/> [Encoder type] This parameter can be accessed if an incremental encoder card has been inserted. To be configured in accordance with the type of encoder used. <input type="checkbox"/> [No] (nO) : Function inactive. <input type="checkbox"/> [AABB] (AAbb) : For signals A, A-, B, B- or A, A-, B, B-, Z, Z- <input type="checkbox"/> [AB] (Ab) : For signals A, B. <input type="checkbox"/> [A] (A) : For signal A. Value cannot be accessed if [Encoder usage] (EnU) = [Spd fdk reg.] (rEG)		[AABB] (AAbb)
EnC	<input type="checkbox"/> [Encoder check] Check encoder feedback. See procedure page 150. This parameter can be accessed if an encoder card has been inserted and if [Encoder usage] (EnU) is not [Speed ref.] (PGr) . <input type="checkbox"/> [Not done] (nO) : Check not performed. <input type="checkbox"/> [Yes] (YES) : Activates monitoring of the encoder. <input type="checkbox"/> [Done] (dOnE) : Check performed successfully. The check procedure checks: - The direction of rotation of the encoder/motor - The presence of signals (wiring continuity) - The number of pulses/revolution If a fault is detected, the drive locks in [Encoder fault] (EnF) fault mode.		[Not done] (nO)
EnU	<input type="checkbox"/> [Encoder usage] This parameter can be accessed if an encoder card has been inserted. <input type="checkbox"/> [No] (nO) : Function inactive, In this case, the other parameters cannot be accessed. <input type="checkbox"/> [Fdbk monit.] (SEC) : The encoder provides speed feedback for monitoring only. <input type="checkbox"/> [Spd fdk reg.] (rEG) : The encoder provides speed feedback for regulation and monitoring. This configuration is automatic if the drive is configured for closed-loop operation ([Motor control type] (Ctt) = [FVC] (FUC) or [Sync.CL] (FSY)). If [Motor control type] (Ctt) = [SVC V] (UUC) the encoder operates in speed feedback mode and enables static correction of the speed to be performed. This configuration is not accessible for other [Motor control type] (Ctt) values. <input type="checkbox"/> [Speed ref.] (PGr) : The encoder provides a reference. Can only be selected with an incremental encoder card. <input type="checkbox"/> [Slip Comp.] (COr) : The encoder provides speed feedback for speed correction and monitoring. This configuration is accessible if [Motor control type] (Ctt) is set to [Sync.CL] (FSY) . The encoder enables a dynamic and static correction of the speed. This choice could be used in case of random error on the encoder feedback (encoder slipping at high speed for example). The less the encoder feedback is reliable, the more the drive will work as in open-loop operation.		[No] (nO)
EnrI	<input type="checkbox"/> [Coder rotation inv.] This parameter can be accessed if an encoder card has been inserted. Activates reversal of encoder rotation. In some assemblies, the encoder positive direction of rotation is reversed in relation to the motor direction. When this is the case, this parameter needs to be activated in order for the motor and the encoder both to have a positive direction of rotation. <input type="checkbox"/> [No] (nO) : Reversal not activated <input type="checkbox"/> [Yes] (YES) : Reversal activated		[No] (nO)

[1.5 INPUTS / OUTPUTS CFG] (I-O-)

Use of analog output AO1 as a logic output

Analog output AO1 can be used as a logic output, by assigning dO1. In this case, state 0 of this output corresponds to the minimum value of AO1 (0 V or 0 mA, for example), and state 1 corresponds to the maximum value of AO1 (10 V or 20 mA, for example).

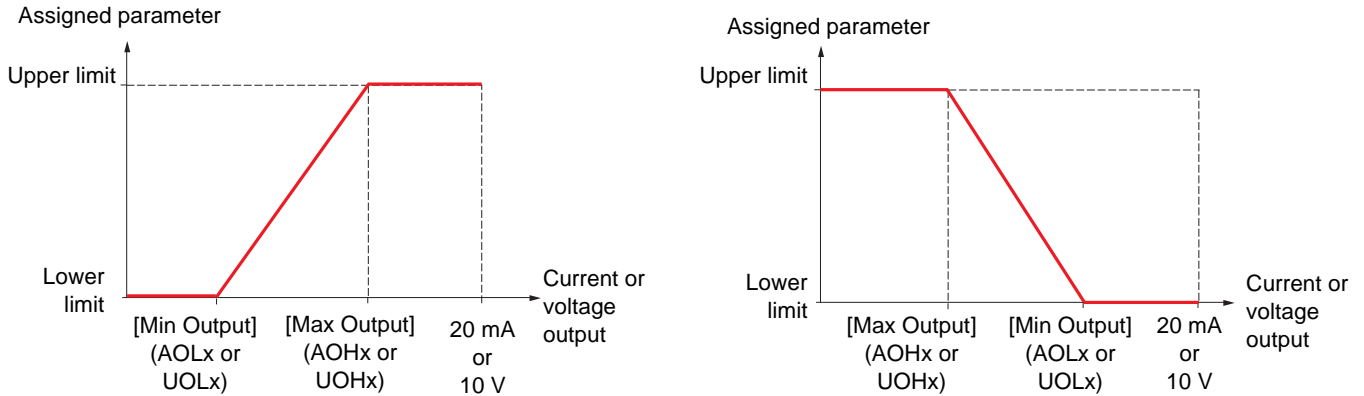

The electrical characteristics of this analog output remain unchanged. As they differ from logic output characteristics, check that they are compatible with the intended application.

Code	Name/Description	Adjustment range	Factory setting

Configuration of analog outputs

Minimum and maximum values (output values):

The minimum output value, in volts or mA, corresponds to the lower limit of the assigned parameter and the maximum value corresponds to its upper limit. The minimum value may be greater than the maximum value:

Outputs AO2 and AO3 configured as bipolar outputs (strongly recommended for signed parameters):

The [min Output] (UOLx) and [max Output] (UOHx) parameters are absolute values, although they function symmetrically. In the case of bipolar outputs, always set the maximum value higher than the minimum value.

The [max Output] (UOHx) corresponds to the upper limit of the assigned parameter, and the [min Output] (UOLx) corresponds to an average value between the upper and lower limits (0 for a signed and symmetrical parameter such as in the example below).

[1.5 INPUTS / OUTPUTS CFG] (I-O-)

Scaling of the assigned parameter

The scale of the assigned parameter can be adapted in accordance with requirements by modifying the values of the lower and upper limits by means of two parameters for each analog output.

These parameters are given as a %; 100% corresponds to the total variation range of the configured parameter, so:

- 100% = upper limit - lower limit. For example, for [Sign. torque] (Stq), which varies between -3 and +3 times the rated torque, 100% corresponds to 6 times the rated torque.

- The parameter [Scaling AOx min] (ASLx) modifies the lower limit: new value = lower limit + (range x ASLx). The value 0% (factory setting) does not modify the lower limit.
- The [Scaling AOx max] (ASHx) parameter modifies the upper limit: new value = lower limit + (range x ASHx). The value 100% (factory setting) does not modify the upper limit.
- [Scaling AOx min] (ASLx) must always be lower than [Scaling AOx max] (ASHx).

Application example 1

The value of the signed motor torque at the AO2 output is to be transferred with +/- 10 V, with a range of -2 Tr to +2 Tr.

The parameter [Sign. torque.] (Stq) varies between -3 and +3 times the rated torque, or a range of 6 times the rated torque.

[Scaling AO2 min] (ASL2) must modify the lower limit by 1x the rated torque, or $100/6 = 16.7\%$ (new value = lower limit + (range x ASL2)).

[Scaling AO2 max] (ASH2) must modify the upper limit by 1x the rated torque, or $100 - 100/6 = 83.3\%$ (new value = lower limit + (range x ASH2)).

Application example 2

The value of the motor current at the AO2 output is to be transferred with 0 - 20 mA, with a range of 2 In motor, In motor being the equivalent of a 0.8 In drive.

The parameter [I motor] (OCr) varies between 0 and 2 times the rated drive current, or a range of 2.5 times the rated drive current.

[Scaling AO2 min] (ASL2) must not modify the lower limit, which therefore remains at its factory setting of 0%.

[Scaling AO2 max] (ASH2) must modify the upper limit by 0.5x the rated motor torque, or $100 - 100/5 = 80\%$ (new value = lower limit + (range x ASH2)).

[1.5 INPUTS / OUTPUTS CFG] (I-O-)

The following submenus group the alarms into 1 to 3 groups, each of which can be assigned to a relay or a logic output for remote signaling. These groups can also be displayed on the graphic display terminal (see [6 MONITORING CONFIG.] menu) and viewed via the [1.2 MONITORING] (SUP) menu.

When one or a number of alarms selected in a group occurs, this alarm group is activated.

[1.6 COMMAND] (CtL-)

With graphic display terminal:

With integrated display terminal:

[1.6 COMMAND] (CtL-)

The parameters in the [1.6 COMMAND] (CtL) menu can only be modified when the drive is stopped and no run command is present.

Command and reference channels

Run commands (forward, reverse, stop, etc.) and references can be sent using the following channels:

Control	Reference
<ul style="list-style-type: none">• Terminals: Logic inputs LI• Graphic terminal• Integrated Modbus• Integrated CANopen• Communication card• Controller Inside card	<ul style="list-style-type: none">• Terminals: Analog inputs AI, frequency input, encoder• Graphic terminal• Integrated Modbus• Integrated CANopen• Communication card• Controller Inside card• +/- speed via the terminals• +/- speed via the graphic display terminal

The behavior of the Altivar LIFT can be adapted according to requirements:

- [Not separ.] (SIM): Command and reference are sent via the same channel.
- [Separate] (SEP): Command and reference may be sent via different channels.

In these configurations, control via the communication bus is performed in accordance with the DRIVECOM standard with only 5 freely-assignable bits (see Communication Parameters Manual). The application functions cannot be accessed via the communication interface.

- [I/O profile] (IO): Command and reference may be sent via different channels. This configuration both simplifies and extends use via the communication interface.

Commands may be sent via the logic inputs on the terminals or via the communication bus.

When commands are sent via a bus, they are available on a word, which acts as virtual terminals containing only logic inputs.

Application functions can be assigned to the bits in this word. More than one function can be assigned to the same bit.

Note: Stop commands from the terminals remain active even if the terminals are not the active command channel.

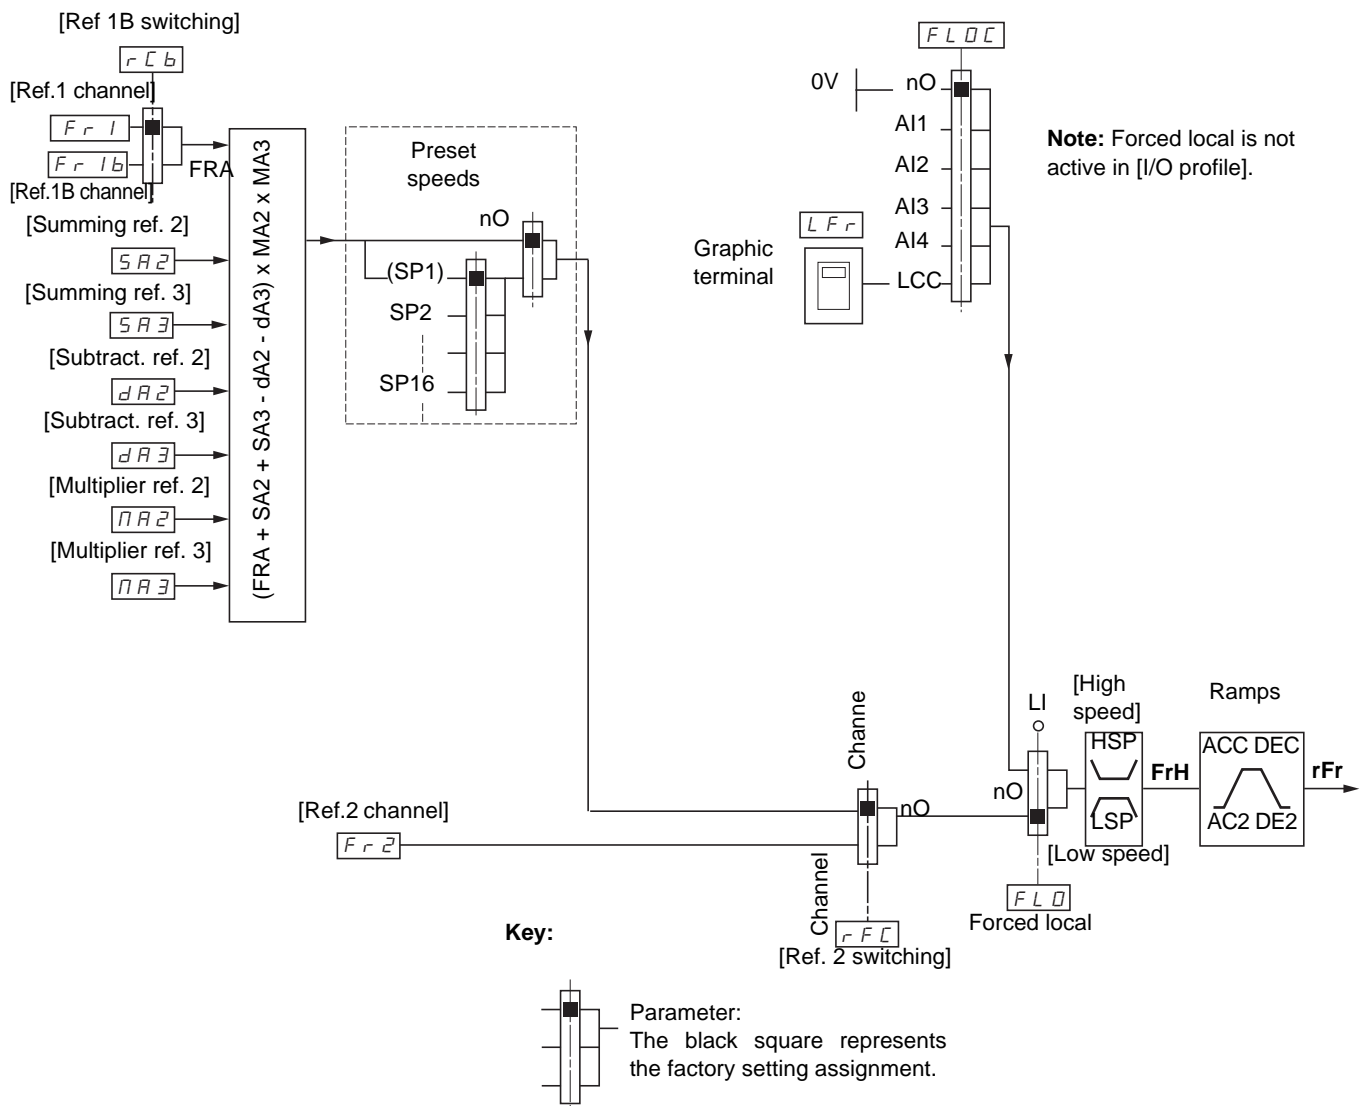

Note: The integrated Modbus channel has two physical communication ports:

- The Modbus network port
- The Modbus HMI port

The drive does not differentiate between these two ports, but recognizes the graphic display terminal irrespective of the port to which it is connected.

[1.6 COMMAND] (CtL-)

Reference channel for [Not separ.] (SIM), [Separate] (SEP) and [I/O profile] (IO) configurations

References

Fr1, SA2, SA3, dA2, dA3, MA2, MA3:

- Terminals, graphic display terminal, integrated Modbus, integrated CANopen, communication card, Controller Inside card

Fr1b, for SEP and IO:

- Terminals, graphic display terminal, integrated Modbus, integrated CANopen, communication card, Controller Inside card

Fr1b, for SIM:

- Terminals, only accessible if Fr1 = terminals

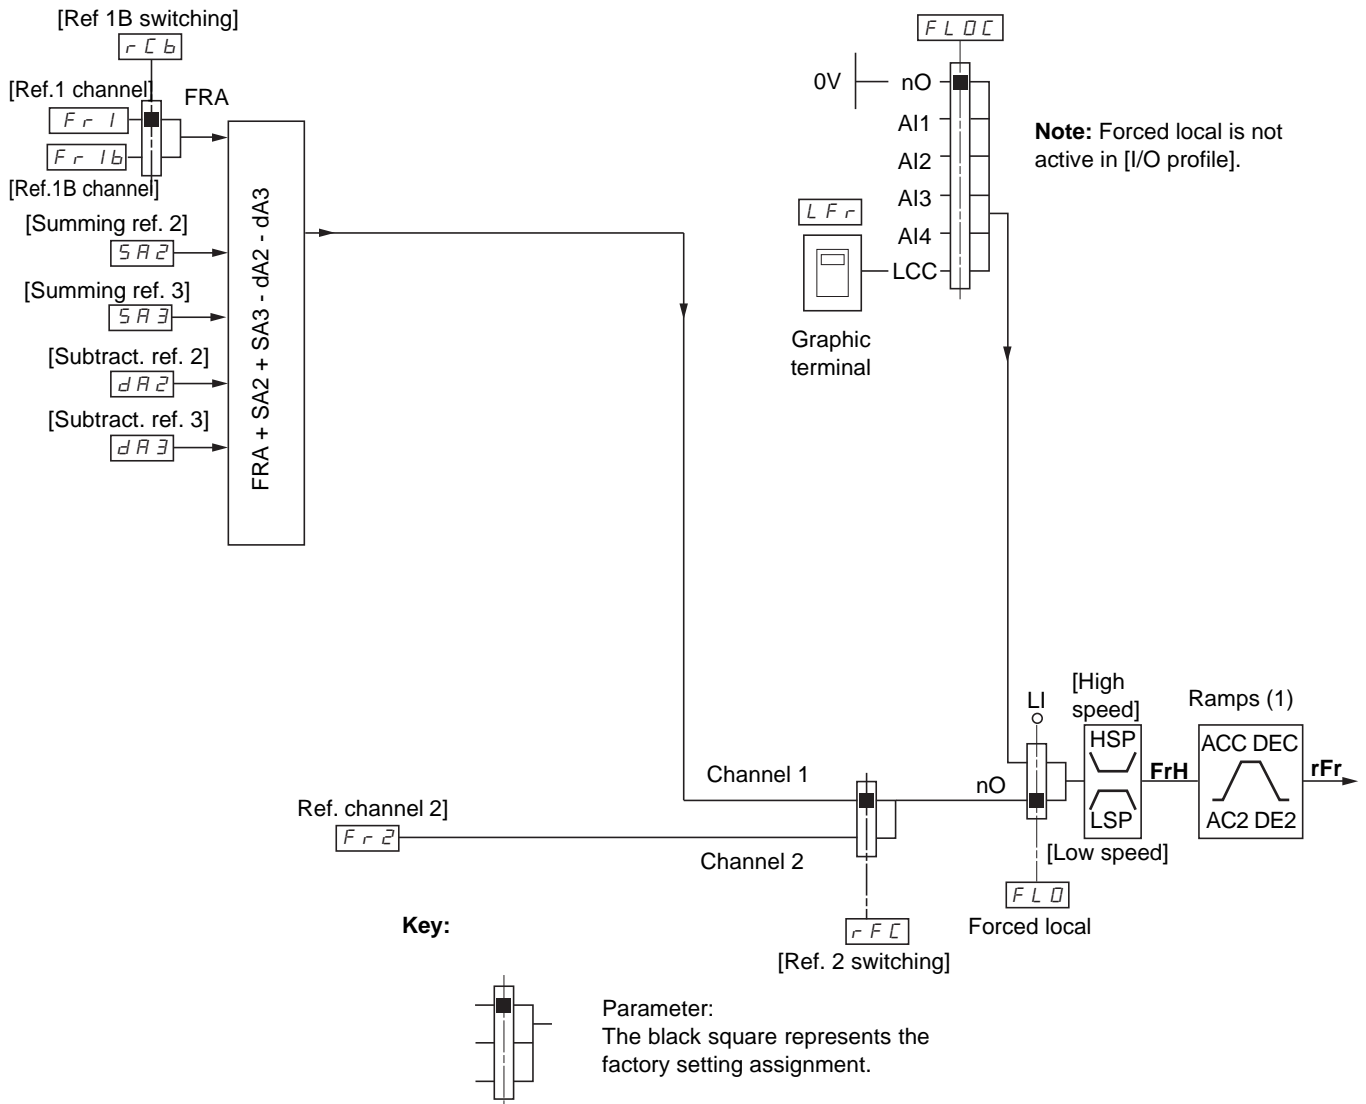

Fr2:

- Terminals, graphic display terminal, integrated Modbus, integrated CANopen, communication card, Controller Inside card

Note: [Ref.1B channel] (Fr1b) and [Ref 1B switching] (rCb) must be configured in the [1.7 APPLICATION FUNCT.] (Fun-) menu.

[1.6 COMMAND] (CtL-)

Reference channel for [Not separ.] (SIM), [Separate] (SEP) and [I/O profile] (IO) configurations

References

Fr1:

- Terminals, graphic display terminal, integrated Modbus, integrated CANopen, communication card, Controller Inside card

Fr1b, for SEP and IO:

- Terminals, graphic display terminal, integrated Modbus, integrated CANopen, communication card, Controller Inside card

Fr1b, for SIM:

- Terminals, only accessible if Fr1 = terminals

SA2, SA3, dA2, dA3:

- Terminals only

Fr2:

- Terminals, graphic display terminal, integrated Modbus, integrated CANopen, communication card, Controller Inside card

(1) Ramps not active if the PID function is active in automatic mode.

Note: [Ref.1B channel] (Fr1b) and [Ref 1B switching] (rCb) must be configured in the [1.7 APPLICATION FUNCT.] (Fun-) menu.

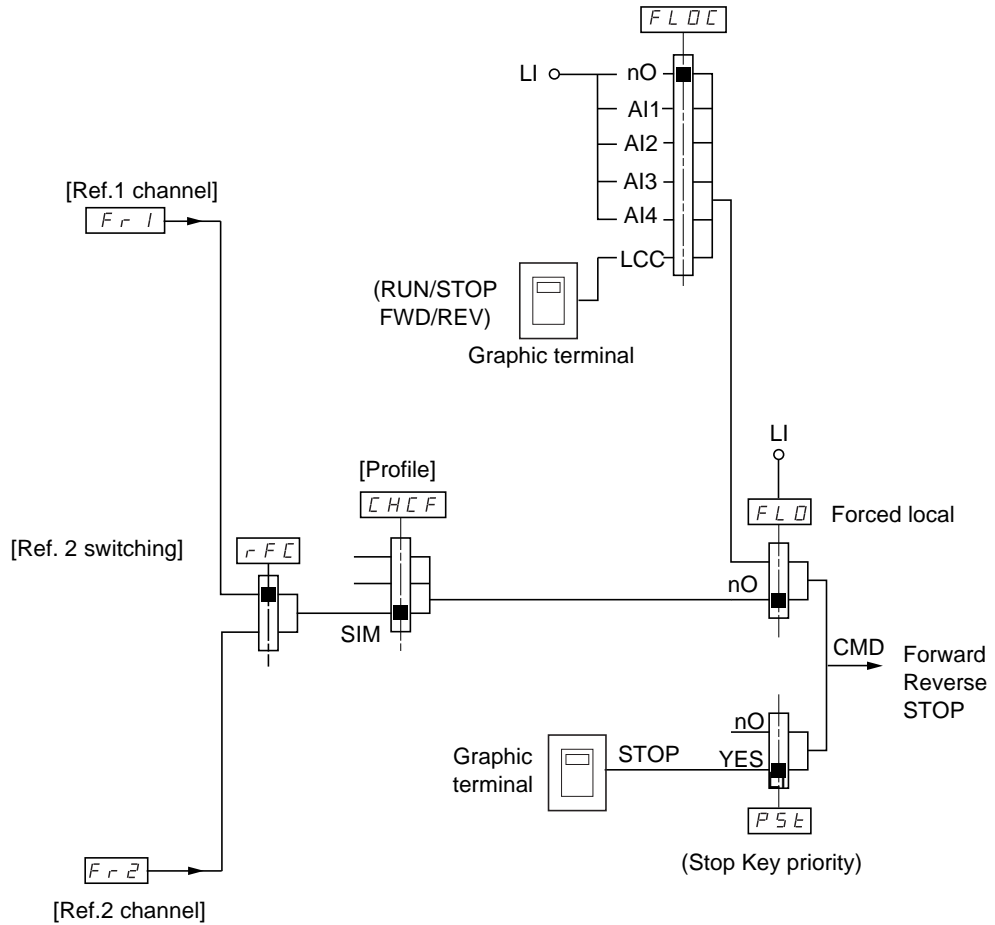

[1.6 COMMAND] (CtL-)

Command channel for [Not separ.] (SIM) configuration

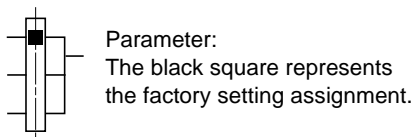

Reference and command, not separate

The command channel is determined by the reference channel. Parameters Fr1, Fr2, rFC, FLO and FLOC are common to reference and command.

For example: If the reference is Fr1 = AI1 (analog input at the terminals), control is via LI (logic input at the terminals).

Key:

[1.6 COMMAND] (CtL-)

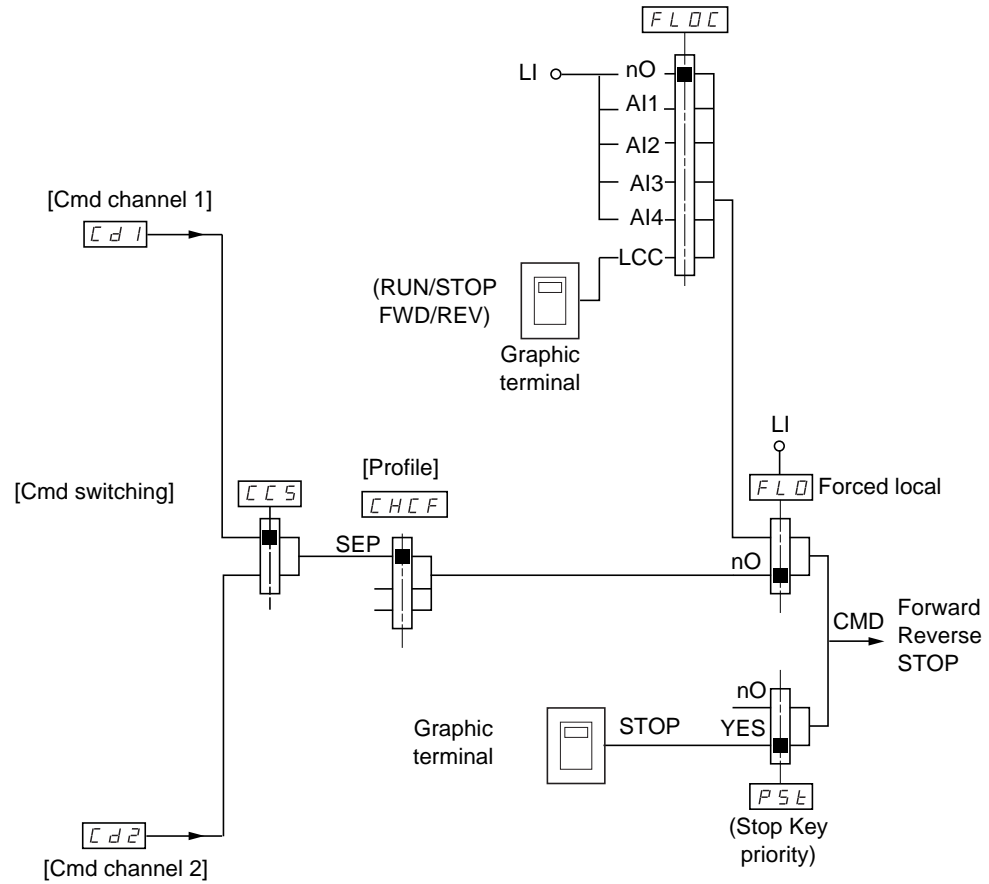

Command channel for [Separate] (SEP) configuration

Separate reference and command

Parameters FLO and FLOC are common to reference and command.

E.g. If the reference is in forced local mode via AI1 (analog input at the terminals), command in forced local mode is via LI (logic input at the terminals).

The command channels Cd1 and Cd2 are independent of the reference channels Fr1, Fr1b and Fr2.

Key:

Parameter:
The black rectangle represents the factory setting assignment, except for [Profile].

Controls

Cd1, Cd2:

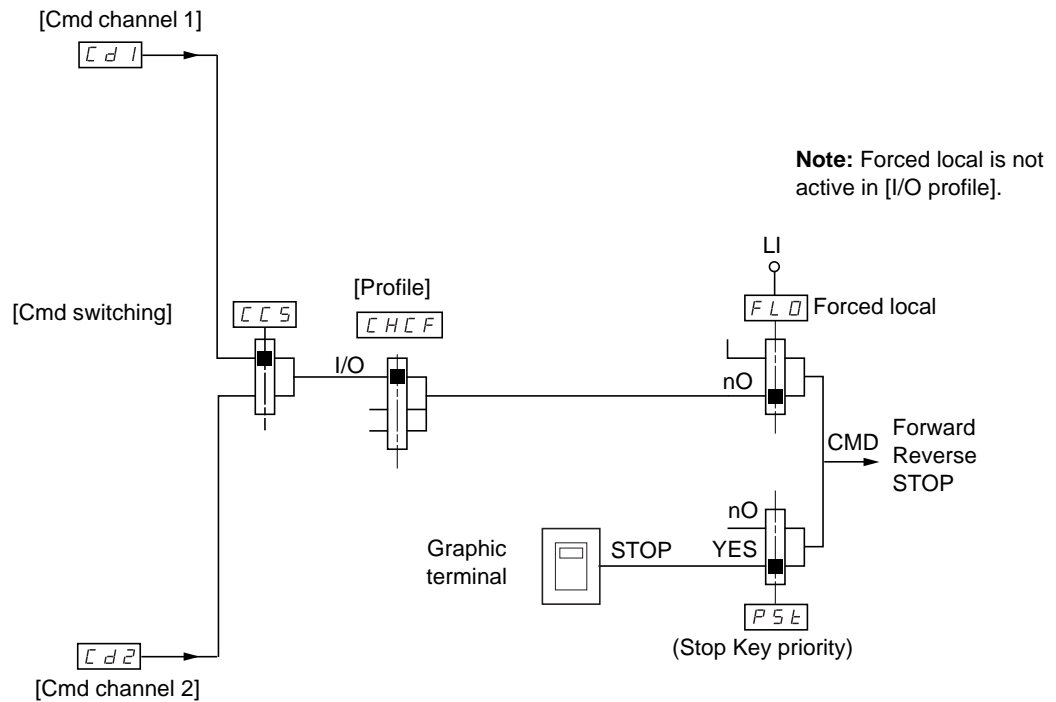

- Terminals, graphic display terminal, integrated Modbus, integrated CANopen, communication card, Controller Inside card

[1.6 COMMAND] (CtL-)

Command channel for [I/O profile] (IO)

Separate reference and command, as in [Separate] (SEP) configuration

The command channels Cd1 and Cd2 are independent of the reference channels Fr1, Fr1b and Fr2.

Key:

Parameter:
The black rectangle represents the factory setting assignment, except for [Profile].

Controls

Cd1, Cd2:

- Terminals, graphic display terminal, integrated Modbus, integrated CANopen, communication card, Controller Inside card

Command channel for [I/O profile] (IO)

Selection of a command channel:

A command or an action can be assigned:

- To a fixed channel by selecting an LI input or a Cxxx bit:
 - By selecting e.g., LI3, this action will be triggered by LI3 regardless of which command channel is switched.
 - By selecting e.g., C214, this action will be triggered by integrated CANopen with bit 14 regardless of which command channel is switched.

- To a switchable channel by selecting a CDxx bit:
 - By selecting, e.g., CD11, this action will be triggered by
 - LI12 if the terminals channel is active
 - C111 if the integrated Modbus channel is active
 - C211 if the integrated CANopen channel is active
 - C311 if the communication card channel is active
 - C411 if the Controller Inside card channel is active

If the active channel is the graphic display terminal, the functions and commands assigned to CDxx switchable internal bits are inactive.

Note:

- CD14 and CD15 can only be used for switching between 2 networks. They do not have equivalent logic inputs.

Terminals	Integrated Modbus	Integrated CANopen	Communication card	Controller Inside card	Internal bit, can be switched
					CD00
LI2 (1)	C101 (1)	C201 (1)	C301 (1)	C401 (1)	CD01
LI3	C102	C202	C302	C402	CD02
LI4	C103	C203	C303	C403	CD03
LI5	C104	C204	C304	C404	CD04
LI6	C105	C205	C305	C405	CD05
LI7	C106	C206	C306	C406	CD06
LI8	C107	C207	C307	C407	CD07
LI9	C108	C208	C308	C408	CD08
LI10	C109	C209	C309	C409	CD09
LI11	C110	C210	C310	C410	CD10
LI12	C111	C211	C311	C411	CD11
LI13	C112	C212	C312	C412	CD12
LI14	C113	C213	C313	C413	CD13
-	C114	C214	C314	C414	CD14
-	C115	C215	C315	C415	CD15

(1) If [2/3 wire control] (tCC) page 174 = [3 wire] (3C), LI2, C101, C201, C301, and C401 cannot be accessed.

[1.6 COMMAND] (CtL-)

Assignment conditions for logic inputs and control bits

The following elements are available for every command or function that can be assigned to a logic input or a control bit:

[L11] (L11) to [L16] (L16)	Drive with or without option
[L17] (L17) to [L110] (L110)	With VW3A3201 logic I/O card
[L111] (L111) to [L114] (L114)	With VW3A3202 extended I/O card
[C101] (C101) to [C110] (C110)	With integrated Modbus in [I/O profile] (IO) configuration
[C111] (C111) to [C115] (C115)	With integrated Modbus regardless of configuration
[C201] (C201) to [C210] (C210)	With integrated CANopen in [I/O profile] (IO) configuration
[C211] (C211) to [C215] (C215)	With integrated CANopen regardless of configuration
[C301] (C301) to [C310] (C310)	With a communication card in [I/O profile] (IO) configuration
[C311] (C311) to [C315] (C315)	With a communication card regardless of configuration
[C401] (C401) to [C410] (C410)	With Controller Inside card in [I/O profile] (IO) configuration
[C411] (C411) to [C415] (C415)	With Controller Inside card regardless of configuration
[CD00] (Cd00) to [CD10] (Cd10)	In [I/O profile] (IO) configuration
[CD11] (Cd11) to [CD15] (Cd15)	Regardless of profile

 **Note:** In [I/O profile] (IO) configuration, L11 cannot be accessed and if [2/3 wire control] (tCC) page 174 = [3 wire] (3C), L12, C101, C201, C301, and C401 cannot be accessed either.

WARNING

LOSS OF CONTROL

Inactive communication channels are not monitored (no lock following malfunction in the event of a communication bus failure). Make sure that the commands and functions assigned to bits C101 to C415 will not pose a risk in the event of the failure of the associated communication bus.

Failure to follow this instruction can result in death or serious injury.

<p>COP</p> <p>nO</p> <p>SP</p> <p>Cd</p> <p>ALL</p>	<p><input type="checkbox"/> [Copy channel 1 <> 2]</p> <p>Can be used to copy the current reference and/or the command by means of switching, in order to avoid speed surges, for example.</p> <p>If [Profile] (CHCF) page 212 = [Not separ.] (SIM) or [Separate] (SEP), copying will only be possible from channel 1 to channel 2.</p> <p>If [Profile] (CHCF) = [I/O profile] (IO), copying will be possible in both directions.</p> <p><input type="checkbox"/> [No] (nO): No copy</p> <p><input type="checkbox"/> [Reference] (SP): Copy reference</p> <p><input type="checkbox"/> [Command] (Cd): Copy command</p> <p><input type="checkbox"/> [Cmd + ref.] (ALL): Copy command and reference</p> <ul style="list-style-type: none"> - A reference or a command cannot be copied to a channel on the terminals. - The reference copied is FrH (before ramp) unless the destination channel reference is set via +/- speed. In this case, the reference copied is rFr (after ramp). <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p style="text-align: center;">⚠ DANGER</p> <p>UNINTENDED EQUIPMENT OPERATION</p> <p>Copying the command and/or reference can change the direction of rotation. Check that this is safe. Failure to follow this instruction can result in death or serious injury.</p> </div>		<p>[No] (nO)</p>

[1.6 COMMAND] (CtL-)

As the graphic display terminal may be selected as the command and/or reference channel, its action modes can be configured. The parameters on this page can only be accessed on the graphic display terminal, and not on the integrated display terminal.

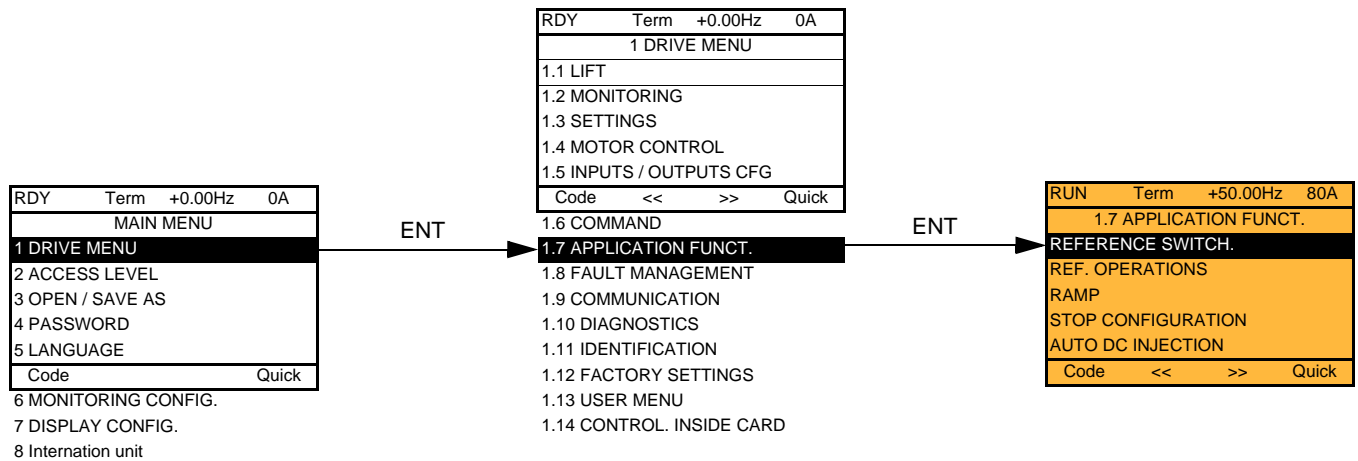

Comments:

- The display terminal command/reference is only active if the command and/or reference channels from the terminal are active with the exception of [T/K] (command via the display terminal), which takes priority over these channels. Press [T/K] (command via the display terminal) again to revert control to the selected channel.
- Command and reference via the display terminal are impossible if the latter is connected to more than one drive.
- The preset speed function can only be accessed if [Profile] (CHCF) = [Not separ.] (SIM).
- The [T/K] function (command via the display terminal) can be accessed regardless of the [Profile] (CHCF).

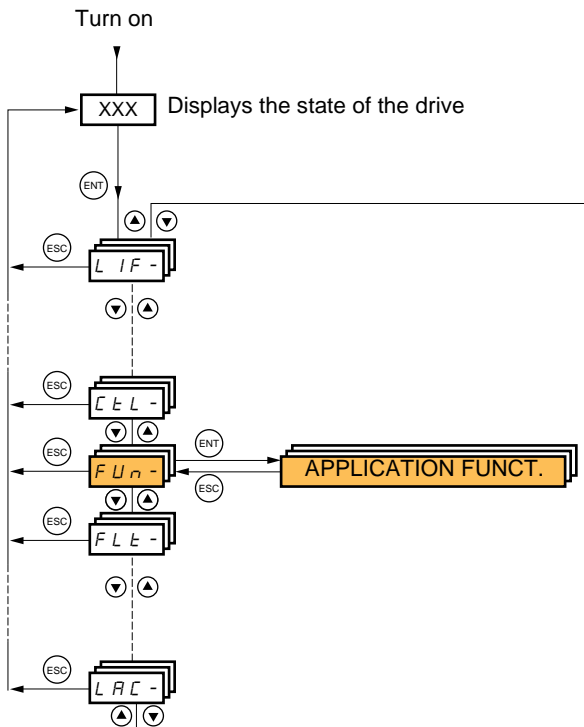

Code	Name/Description	Adjustment range	Factory setting
F П 1 n 0 F P S 1 F P S 2 F E	<input type="checkbox"/> [F1 key assignment] <input type="checkbox"/> [No] : Not assigned, <input type="checkbox"/> [Preset spd2] : Press the key to run the drive at the 2 nd preset speed [Preset speed 2] (SP2) page 233. Press STOP to stop the drive. <input type="checkbox"/> [Preset spd3] : Press the key to run the drive at the 3 rd preset speed [Preset speed 3] (SP3) page 233. Press STOP to stop the drive. <input type="checkbox"/> [T/K] : Control via the display terminal: Takes priority over [Cmd switching] (CCS) and over [Ref. 2 switching] (rFC).		[No] (nO)
F П 2	<input type="checkbox"/> [F2 key assignment] Identical to [F1 key assignment].		[No] (nO)
F П 3	<input type="checkbox"/> [F3 key assignment] Identical to [F1 key assignment].		[No] (nO)
F П 4	<input type="checkbox"/> [F4 key assignment] Identical to [F1 key assignment].		[No] (nO)
б П П S O P б У П П	<input type="checkbox"/> [HMI cmd.] When the [T/K] function is assigned to a key and that function is active, this parameter defines the behavior at the moment when control returns to the graphic display terminal. <input type="checkbox"/> [Stop] : Stops the drive (although the controlled direction of operation and reference of the previous channel are copied (to be taken into account on the next RUN command)). <input type="checkbox"/> [Bumpless] : Does not stop the drive (the controlled direction of operation and the reference of the previous channel are copied).		[Stop] (StOP)

[1.7 APPLICATION FUNCT.] (FUn-)

With graphic display terminal:

H F F -	[HALF FLOOR]	266
d C D -	[DC BUS SUPPLY]	267
t D P -	[TOP Z MANAGEMENT]	268

[1.7 APPLICATION FUNCT.] (FUn-)

The parameters in the [\[1.7 APPLICATION FUNCT.\] \(FUn-\)](#) menu can only be modified when the drive is stopped and there is no run command, except for parameters with a  symbol in the code column, which can be modified with the drive running or stopped.

Note: Compatibility of functions

The choice of application functions may be limited by the number of I/O and by the fact that some functions are incompatible with one another. Functions that are not listed in the table below are fully compatible.

If there is an incompatibility between functions, the first function configured will prevent the others being configured.

Each of the functions on the following pages can be assigned to one of the inputs or outputs.

A single input can activate several functions at the same time (reverse and 2nd ramp, for example). **The user must therefore ensure that these functions can be used at the same time.** It is only possible to assign one input to several functions at [\[Advanced\] \(AdU\)](#) and [\[Expert\] \(EPr\)](#) level.

Before assigning a command, reference or function to an input or output, the user must make sure that this input or output has not already been assigned and that another input or output has not been assigned to an incompatible or undesirable function.

The drive factory setting or macro configurations automatically configure functions, **which may prevent other functions being assigned.** **It may be necessary to unconfigure one or more functions in order to be able to enable another.** Check the compatibility table below.

Compatibility table

	Reference operations (page 223)	Management of limit switches (page 235)	Preset speeds (page 232)	Brake logic control (page 240)	DC injection stop (page 228)	Fast stop (page 228)	Freewheel stop (page 228)	Stop on TDC (page 268)	Torque control (page 248)	Load sharing (page 170)	Open-loop synchronous motor (page 157)	Closed-loop synchronous motor (page 159)	Measurement of motor/encoder phase shift (page 160)
Reference operations (page 223)			↑						●(1)				
Management of limit switches (page 235)													
Preset speeds (page 232)	←								●(1)				
Brake logic control (page 240)				●					●		●		●(4)
DC injection stop (page 228)				●	●(2)	↑	●(2)				●	●	
Fast stop (page 228)				●(2)		↑	●(2)						
Freewheel stop (page 228)				←	←		←						
Stop on TDC (page 268)				●(2)	●(2)	↑							
Torque control (page 248)	●(1)	●(1)	●							●	●		
Load sharing (page 170)									●				
Open-loop synchronous motor (page 157)				●	●				●				
Closed-loop synchronous motor (page 159)				●									
Measurement of motor/encoder phase shift (page 160)			●(4)										

- (1) Torque control and these functions are only incompatible while torque control mode is active.
- (2) Priority is given to the first of these two stop modes to be activated.
- (3) Excluding special application with reference channel Fr2 (see diagrams on pages 205 and 206).
- (4) These two functions are incompatible only if [Angle setting type] (ASt) = [W/o load] (nLd).

Incompatible functions
 Compatible functions
 Not applicable

Priority functions (functions, which cannot be active at the same time):

← ↑ The function indicated by the arrow has priority over the other.

Stop functions have priority over run commands.
 Speed references via logic command have priority over analog references.

 **Note:** This compatibility table does not affect commands that can be assigned to the keys of the graphic display terminal (see page 215).

[1.7 APPLICATION FUNCT.] (FUn-)

Incompatible functions

The following function will be inaccessible or deactivated in the cases described below:

Automatic restart

This is only possible for control type [2/3 wire control] (tCC) = [2 wire] (2C) and [2 wire type] (tCt) = [Level] (LEL) or [Fwd priority] (PFO). See page 174.

The SUP- monitoring menu (page 124) can be used to display the functions assigned to each input in order to check their compatibility.

When a function is assigned, a ✓ appears on the graphic display terminal, as illustrated in the example below:

RDY	Term	+0.00Hz	0A
1.7 APPLICATION FUNCT.			
REFERENCE SWITCH.			
REF. OPERATIONS			
RAMP			
STOP CONFIGURATION			
AUTO DC INJECTION			
Code	<<	>>	Quick

PSS

If you attempt to assign a function that is incompatible with another function that has already been assigned, an alarm message will appear:

With the graphic display terminal:

RDY	Term	+0.00Hz	0A
INCOMPATIBILITY			
The function can't be assigned			
because an incompatible			
function is already selected. See			
programming book.			
ENT or ESC to continue			

With the integrated display terminal:

COMP flashes until ENT or ESC is pressed.

When you assign a logic input, an analog input, a reference channel or a bit to a function, pressing the HELP button will display the functions that may already have been activated by this input, bit or channel.

[1.7 APPLICATION FUNCT.] (FUn-)

When a logic input, an analog input, a reference channel or a bit that has already been assigned is assigned to another function, the following screens appear:

With the graphic display terminal:

RUN	+50.00Hz	1,250	+50.00Hz
A			
WARNING - ASSIGNED TO			
Ref. 2 switching			
ENT->Continue		ESC->Cancel	

If the access level permits this new assignment, pressing ENT confirms the assignment.

If the access level does not permit this new assignment, pressing ENT results in the following display:

RUN	+50.00Hz	1,250	+50.00Hz
A			
ASSIGNMENT FORBIDDEN			
Un-assign the present			
functions, or select			
Advanced access level			

With the integrated display terminal:

The code for the first function, which is already assigned, is displayed flashing.

If the access level permits this new assignment, pressing ENT confirms the assignment.

If the access level does not permit this new assignment, pressing ENT has no effect, and the message continues to flash. It is only possible to exit by pressing ESC.

Summing input/Subtracting input/Multiplier

$$A = (\text{Fr1 or Fr1b} + \text{SA2} + \text{SA3} - \text{dA2} - \text{dA3}) \times \text{MA2} \times \text{MA3}$$

- If SA2, SA3, dA2, dA3 are not assigned, they are set to 0.
- If MA2, MA3 are not assigned, they are set to 1.
- A is limited by the minimum LSP and maximum HSP parameters.
- For multiplication, the signal on MA2 or MA3 is interpreted as a %; 100% corresponds to the maximum value of the corresponding input. If MA2 or MA3 is sent via the communication bus or graphic display terminal, an MFr multiplication variable (see page [130](#)) must be sent via the bus or graphic display terminal.
- Reversal of the direction of operation in the event of a negative result can be inhibited (see page [212](#)).

 Parameter that can be modified during operation or when stopped.

Limit switch management

This function can be used to manage trajectory limits using limit switches.

The stop mode is configurable.

When the stop contact is activated, startup in the other direction is authorized.

E.g.

The stop is activated when the input is at inactive state (contact open).

[1.7 APPLICATION FUNCT.] (FUn-)

Code	Name/Description	Adjustment range	Factory setting

LAr	<input type="checkbox"/> [Stop RV limit sw.] Same assignments possible as for [Stop FW limit sw.] (LAF) below.		[No] (nO)
LAS rMP FSt nSt	<input type="checkbox"/> [Stop type] <input type="checkbox"/> [Ramp stop] (rMP) <input type="checkbox"/> [Fast stop] (FSt) <input type="checkbox"/> [Freewheel] (nSt) When the assigned input changes to 0, the stop is controlled in accordance with the selected type. Restarting is only authorized for the other operating direction once the motor has stopped. If the two inputs [Stop FW limit sw.] (LAF) and [Stop RV limit sw.] (LAr) are assigned and at state 0, restarting will be impossible. This parameter can be accessed if [Stop FW limit sw.] (LAF) or [Stop RV limit sw.] (LAr) is assigned.		[Freewheel] (nSt)

Brake logic control

Used to control an electromagnetic brake by the drive, for horizontal and vertical hoisting applications, and for unbalanced machines.

Principle:

Vertical hoisting movement:

Maintain motor torque in the driving load holding direction during brake opening and closing, in order to hold the load, start smoothly when the brake is released and stop smoothly when the brake is engaged.

Horizontal hoisting movement:

Synchronize brake release with the build-up of torque during startup and brake engage at zero speed on stopping, to help to prevent jolting.

Recommended settings for brake logic control for a vertical hoisting application:

▲ WARNING
LOSS OF CONTROL Check that the selected settings and configurations will not result in the dropping or loss of control of the load being lifted. Failure to follow this instruction can result in death or serious injury.

1. Brake impulse (bIP): YES. Ensure that the direction of rotation FW corresponds to lifting the load.
For applications in which the load being lowered is very different from the load being lifted, set BIP = 2 lbr (e.g., ascent always with a load and descent always without a load).
2. Brake release current (lbr and lrd if BIP = 2 lbr): Adjust the brake release current to the rated current indicated on the motor.
During testing, adjust the brake release current in order to hold the load smoothly.
3. Acceleration time: For hoisting applications it is advisable to set the acceleration ramps to more than 0.5 seconds. Ensure that the drive does not exceed the current limit.
The same recommendation applies for deceleration.
Reminder: For a hoisting movement, a braking resistor should be used.
4. Brake release time (brt): Set according to the type of brake. It is the time required for the mechanical brake to release.
5. Brake release frequency (blr), in open-loop mode only: Leave in [Auto], adjust if necessary.
6. Brake engage frequency (bEn): Leave in [Auto], adjust if necessary.
7. Brake engage time (bEt): Set according to the type of brake. It is the time required for the mechanical brake to engage.

Recommended settings for brake logic control for a horizontal hoisting application:

1. Brake impulse (bIP): No
2. Brake release current (lbr): Set to 0.
3. Brake release time (brt): Set according to the type of brake. It is the time required for the mechanical brake to release.
4. Brake engage frequency (bEn), in open-loop mode only: Leave in [Auto], adjust if necessary.
5. Brake engage time (bEt): Set according to the type of brake. It is the time required for the mechanical brake to engage.

Brake logic control, horizontal movement in open-loop mode

IbrA 	<input type="checkbox"/> [Ibr 4-20 mA loss] Brake release current in the event of the loss of the weight sensor information. This parameter can be accessed if the weight sensor has been assigned to an analog current input and the 4-20 mA loss detected fault is deactivated. Recommended settings: - 0 for lifts - Rated motor current for a hoisting application	0 to 1.36 ln (1)	0

(1) ln corresponds to the rated drive current indicated in the Installation Manual and on the drive nameplate.

 Parameter that can be modified during operation or when stopped.

Torque regulation

The function can be used to switch between operation in speed regulation mode and operation in torque control mode. In torque control mode, the speed may vary within a configurable "deadband". When it reaches a lower or upper limit, the drive automatically reverts to speed regulation mode (fallback) and remains at this limit speed. The regulated torque is therefore no longer maintained and two scenarios may occur.

- If the torque returns to the required value, the drive will return to torque control mode.
- If the torque does not return to the required value at the end of a configurable period of time, the drive will switch to fault or alarm state.

▲ WARNING

LOSS CONTROL

Check that the changes in the behavior of the motor do not present any danger.
Failure to follow this instruction can result in death or serious injury.

- AB and CD: "Fallback" to speed regulation
- BC: Torque control zone
- E: Ideal operating point

The torque sign and value can be transmitted via a logic output and an analog output.

-  **Note:** If the motor is equipped with an encoder assigned to speed feedback, the "torque control" function will trigger a **[Load slipping] (AnF)** fault. One of the following solutions should be applied:
- Set **[Load slip detection] (Sdd)** page 285 = **[No] (nO)**.
 - Set both **[Positive deadband] (dbP)** and **[Negative deadband] (dbn)** to a value less than 10% of the rated motor frequency.

 Parameter that can be modified during operation or when stopped.

Torque limitation

There are two types of torque limitation:

- With a value that is fixed by a parameter
- With a value that is set by an analog input (AI, pulse or encoder)

If both types are enabled, the lowest value is taken into account. The two types of limitation can be configured or switched remotely using a logic input or via the communication bus.

(2) In corresponds to the rated drive current indicated in the Installation Manual and on the drive nameplate.

 Parameter that can be modified during operation or when stopped.

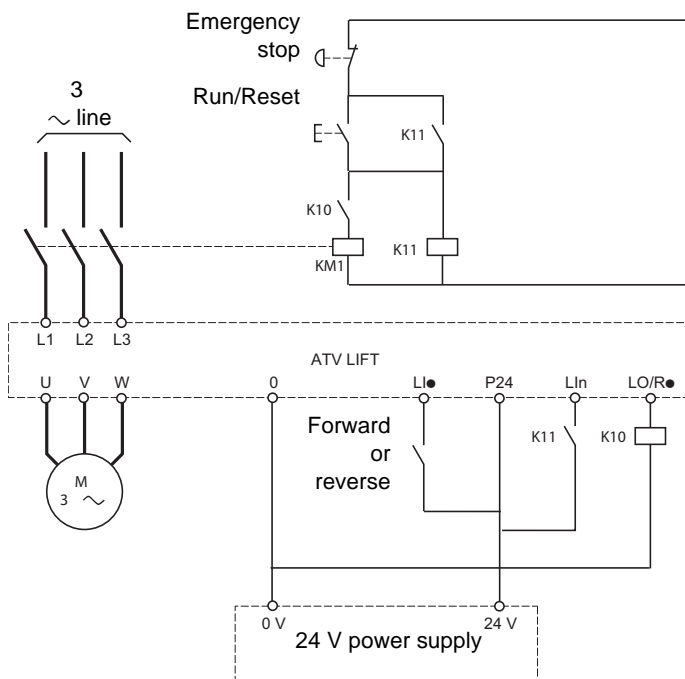

[1.7 APPLICATION FUNCT.] (FUn-)

Line contactor command

The line contactor closes every time a run command (forward or reverse) is sent and opens after every stop, as soon as the drive is locked. For example, if the stop mode is stop on ramp, the contactor will open when the motor reaches zero speed.

 **Note:** The drive control power supply must be provided via an external 24 V source.

Example circuit:

Note: The "Run/Reset" button must be pressed once the "Emergency stop" button has been released.

L● = Run command [Forward] or [Reverse]
LO/R● □ [Line contactor ass.] (LLC)
Lln = [Drive lock] (LES)

CAUTION

RISK OF DAMAGE TO THE MOTOR

This function can only be used for a small number of consecutive operations with a cycle time longer than 60 s (in order to avoid premature aging of the filter capacitor charging circuit).

Failure to follow these instructions can result in equipment damage.

[1.7 APPLICATION FUNCT.] (FUn-)

Code	Name/Description	Adjustment range	Factory setting
LLC -	[LINE CONTACTOR COMMAND]

[1.7 APPLICATION FUNCT.] (FUn-)

Output contactor command

This allows the drive to control a contactor located between the drive and the motor. The request for the contactor to close is made when a run command is sent. The request for the contactor to open is made when there is no longer any current in the motor.

CAUTION

RISK OF DAMAGE TO THE EQUIPMENT

If a DC injection braking function has been configured it should not be left operating too long in stop mode, as the contactor only opens at the end of braking.

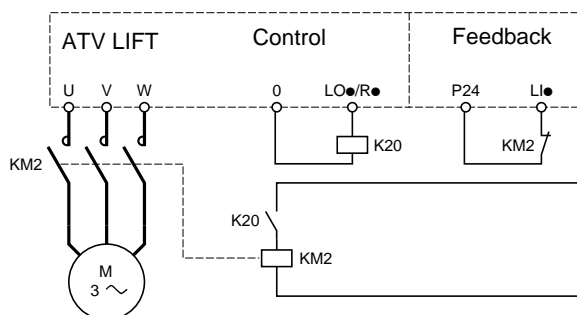

Failure to follow these instructions can result in equipment damage.

Output contactor feedback

The corresponding logic input should be at active state when there is no run command and at inactive state during operation.

In the event of an inconsistency, the drive trips on an FCF2 if the output contactor does not succeed to close (LIx at 1) and on an FCF1 trip if it is stuck (LIx at 0).

The parameter [\[Delay to motor run\] \(dbS\)](#) can be used to delay tripping when a run command is sent and the [\[Delay to open cont.\] \(dAS\)](#) parameter delays the trip when a stop command is set.

The [\[Out. contactor ass.\] \(OCC\)](#) and [\[Output contact. fdbk\] \(rCA\)](#) functions can be used individually or together.

Note: Do not modify the parameters in the [1.3 SETTINGS] (SEt-) menu, because any modifications made in this menu [1.3 SETTINGS] (SEt-) will be lost on the next power-up. The parameters can be adjusted during operation in the [PARAM. SET SWITCHING] (MLP-) menu, on the active configuration.

Note: Parameter set switching cannot be configured from the integrated display terminal.

Parameters can only be adjusted on the integrated display terminal if the function has been configured previously via the graphic display terminal, by PC-Software or via the bus or communication network. If the function has not been configured, the **MLP-** menu and the **PS1-**, **PS2-**, **PS3-** submenus will not appear.

PS2-	<p><input type="checkbox"/> [SET 2]</p> <p>This parameter can be accessed if at least 1 parameter has been selected in [PARAMETER SELECTION]. Procedure identical to [SET 1] (PS1-).</p>																																																										
PS3-	<p><input type="checkbox"/> [SET 3]</p> <p>This parameter can be accessed if [3 parameter sets] is not [No] and if at least 1 parameter has been selected in [PARAMETER SELECTION]. Procedure identical to [SET 1] (PS1-).</p>																																																										

Note: We recommend that a parameter set switching test is carried out while stopped and a check is made to help to help to ensure that it has been performed correctly.

Some parameters are interdependent and in this case may be restricted at the time of switching.

Interdependencies between parameters must be respected, even between different sets.

For example: The highest [Low speed] (LSP) must be below the lowest [High speed] (HSP).

Motor or configuration switching [MULTIMOTORS/CONFIG.]

The drive may contain up to 3 configurations, which can be saved using the [1.12 FACTORY SETTINGS] (FCS-) menu, page 299. Each of these configurations can be activated remotely, enabling adaptation to:

- 2 or 3 different motors or mechanisms (multimotor mode)
- 2 or 3 different configurations for a single motor (multiconfiguration mode)

The two switching modes cannot be combined.

Note: The following conditions MUST be observed:

- Switching may only take place when stopped (drive locked). If a switching request is sent during operation, it will not be executed until the next stop.
- In the event of motor switching, the following additional conditions apply:
 - When the motors are switched, the power and control terminals concerned must also be switched as appropriate.
 - The maximum power of the drive must not be exceeded by any of the motors.
- All the configurations to be switched must be set and saved in advance in the same hardware configuration, this being the definitive configuration (option and communication cards). If this instruction is not followed, it can cause the drive to trip in [Incorrect config.] (CFF).

Menu and parameters switched in multimotor mode

- [1.3 SETTINGS] (SEt-)
- [1.4 MOTOR CONTROL] (drC-)
- [1.5 INPUTS / OUTPUTS CFG] (I-O-)
- [1.6 COMMAND] (CtL-)
- [1.7 APPLICATION FUNCT.] (FUn-) with the exception of the [MULTIMOTORS/CONFIG.] function (to be configured once only)
- [1.8 FAULT MANAGEMENT] (FLt)
- [1.13 USER MENU]
- [USER CONFIG.]: The name of the configuration specified by the user in the [1.12 FACTORY SETTINGS] (FCS-) menu

Menu and parameters switched in multiconfiguration mode

As in multimotor mode, except for the motor parameters that are common to the three configurations:

- Rated current
- Thermal current
- Rated voltage
- Rated frequency
- Rated speed
- Rated power
- IR compensation
- Slip compensation
- Synchronous motor parameters
- Type of thermal protection
- Thermal state
- The auto-tuning parameters and motor parameters that can be accessed in Expert mode
- Type of motor control

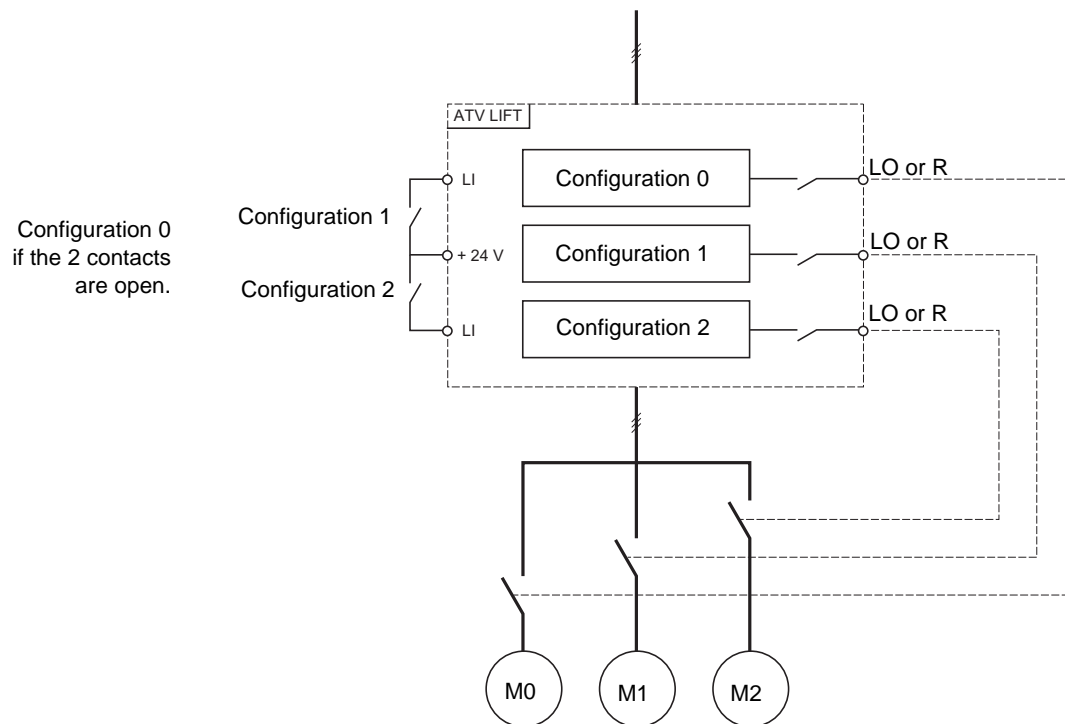

Note: No other menus or parameters can be switched.

Switching command

Depending on the number of motors or selected configuration (2 or 3), the switching command is sent using one or two logic inputs. The table below lists the possible combinations.

LI 2 motors or configurations	LI 3 motors or configurations	Number of configuration or active motor
0	0	0
1	0	1
0	1	2
1	1	2

Schematic diagram for multimotor mode

Auto-tuning in multimotor mode

This auto-tuning can be performed:

- Manually using a logic input when the motor changes
- Automatically each time the motor is activated for the 1st time after turning on the drive, if the [Automatic autotune] (Aut) parameter on page 163 = [Yes] (YES).

Motor thermal states in multimotor mode:

The drive protects the three motors individually. Each thermal state takes into account all stop times, including drive shutdowns. It is, therefore, not necessary to perform auto-tuning every time the power is turned on. It is sufficient to auto-tune each motor at least once.

Configuration information output

In the [1.5 INPUTS / OUTPUTS CFG] (I-O-) menu, a logic output can be assigned to each configuration or motor (2 or 3) for remote information transmission.

Note: As the [1.5 INPUTS / OUTPUTS CFG] (I-O-) menu is switched, these outputs must be assigned in all configurations in which information is required.

rFE -	[EVACUATION] For details of this function, see page 98 .		
rFE - nO L I 1 - L I 14	<input type="checkbox"/> [Evacuation assign.] <input type="checkbox"/> [No] (nO) : Function not assigned <input type="checkbox"/> [LI1] (LI1) to [LI6] (LI6) <input type="checkbox"/> [LI7] (LI7) to [LI10] (LI10) : If VW3A3201 logic I/O card has been inserted <input type="checkbox"/> [LI11] (LI11) to [LI14] (LI14) : If VW3A3202 extended I/O card has been inserted Evacuation is activated when the assigned input is at active state, if the drive is stationary. Evacuation is activated when the assigned input is at inactive state, as soon as the drive stops.		[No] (nO)
r5U	<input type="checkbox"/> [Evacuation Input V.] AC voltage value of the emergency power supply. This parameter can be accessed if [Evacuation assign.] (rFt) is not [No] (nO) .	200 to 480 V	220 V

() Parameter that can be modified during operation or when stopped.

[1.7 APPLICATION FUNCT.] (FUn-)

Code	Name/Description	Adjustment range	Factory setting
ISP -	[INSPECTION MODE] See details page 96		
rSP 	<input type="checkbox"/> [Evacuation freq.] Value of the "Standard evacuation" mode frequency reference. This parameter can be accessed if [Evacuation assign.] (rFt) is not [No] (nO) and [Opt.rescue mode] (OrM) is set to [Standard] (Std) . The adjustment range is determined by the [Low speed] (LSP) (page 135), [Rated motor freq.] (FrS) page 152 for an asynchronous motor or [Nominal freq sync.] (FrSS) page 158 for a synchronous motor and [Rated motor volt.] (UnS) (page 152) parameters and by [Evacuation Input V.] (rSU) above. Example with an asynchronous motor: <ul style="list-style-type: none"> If $LSP < (FrS \times rSU/UnS)$: $rSP \text{ min.} = LSP$, $rSP \text{ max.} = (FrS \times rSU/UnS)$ If $LSP \geq (FrS \times rSU/UnS)$: $rSP = (FrS \times rSU/UnS)$ With a synchronous motor: Same formula using FrSS in place of FrS and 400 V in place of UnS.	0 m/s to [Nominal car speed] (CSP)	5 Hz
OrM Std MANU AUTO	<input type="checkbox"/> [Opt. rescue mode] Optimized rescue mode, visible if [Evacuation assign.] (rFt) is not set to [No] (nO) . <input type="checkbox"/> [Standard] (Std) Standard evacuation mode. This is the Evacuation mode existing on ATV71L. This does not take into account the lift ramp parameters. Lift ramp parameters (distances) are taken into account in the modes [Manual] (MANU) and [Automatic] (AUTO) of the rescue function. <input type="checkbox"/> [Manual] (MANU) Optimized evacuation mode. The optimized direction for rescue mode is available on a logic output if set to [Rescue dir.] (Opt) - Output at passive state (0) means that the forward direction requires less power than reverse. - Output at active state (1) means that the reverse direction requires less power than forward. <input type="checkbox"/> [Automatic] (AUTO) Optimized evacuation mode with direction autodetection that permits to minimize the request UPS power. In that case, the direction will be chosen by the drive whatever the direction requested. Note: When [Opt. rescue mode] (OrM) is set to [Automatic] (Auto) , if the inspection mode is activated and the requested direction is not optimized one, the drive will not start.		[Standard] (Std)
OrSP	<input type="checkbox"/> [Cust. rescue speed] Maximum optimized rescue speed, visible if [Evacuation assign.] (rFt) is not set to [No] (nO) and [Opt. rescue mode] (OrM) is not set to [Standard] (Std) . Note: [Cust. rescue speed] (OrSP) is used as the maximum speed to take into account for the UPS size calculation. Speed reference used during rescue is given by the LIFT ramp, taken into account the [Cust. rescue speed] (OrSP) speed limitation.	0 m/s to [Nominal car speed] (CSP)	0.100 m/s
PnC	<input type="checkbox"/> [Calc. rescue power] Requested UPS power in KVA, visible if [Evacuation assign.] (rFt) is not set to [No] (nO) and [Opt. rescue mode] (OrM) is not set to [Standard] (Std) . This is the power needed by the drive only during evacuation, this does not include third party devices powered by the UPS. The calculated value depends on other parameters value, see page 98 for more details.		

(1) In corresponds to the rated drive current indicated in the Installation Manual and on the drive nameplate.

 Parameter that can be modified during operation or when stopped.

[1.7 APPLICATION FUNCT.] (FUn-)

Code	Name/Description	Adjustment range	Factory setting
rFt -	[EVACUATION] continued For details of this function, see page 98.		
rACC  AUtO 0.01 - 99.9	<input type="checkbox"/> [Acc. time rescue] Acceleration time during rescue, visible if [Evacuation assign.] (rFt) is not set to [No] (nO) and [Opt. rescue mode] (OrM) is not set to [Standard] (Std) <input type="checkbox"/> [Automatic] (AUtO) : Acceleration time is calculated according to [Max. rescue speed] (OrSP) value. <input type="checkbox"/> 0.01 to 99.9	0.01 s to 99.99 s	[Automatic] (AUtO)
rCLI AUtO 0.1 - 1.36	<input type="checkbox"/> [Resc max current] <input type="checkbox"/> [Automatic] (AUtO): Current limitation during rescue visible if [Evacuation assign.] (rFt) is not set to [No] (nO). When [Resc max current] (rCLI) is set to [Automatic] (AUtO), [Resc max current] (rCLI) takes the value of [Rated mot. current] (NCr) (or [Nominal I sync.] (NCrS) if a synchronous motor law is configured) each time the parameter is modified. <input type="checkbox"/> 0.1 to 1.36 In	0.0 A to 1.36 In (1)	[Automatic] (AUtO)
HFF -	[HALF FLOOR] For details of this function, see page 104.		
HLS nO -	<input type="checkbox"/> [Half-floor speed] Activation and adjustment of the "half floor" function. This function has priority over all speed reference functions (preset speeds, for example) with the exception of those generated via fault monitoring (fallback speed, for example). <input type="checkbox"/> [No] (nO): Function inactive. <input type="checkbox"/> 0.1 Hz to 500.0 Hz : Activation of the function by adjusting the motor frequency to be reached prior to slowing down.		[No] (nO)

(1)In corresponds to the rated drive current indicated in the Installation Manual and on the drive nameplate.

 Parameter that can be modified during operation or when stopped.

[1.7 APPLICATION FUNCT.] (FUn-)

Direct power supply via DC bus

This function is only accessible for ATV71LD48N4Z drives.

Direct power supply via the DC bus requires a protected direct current source with adequate power and voltage as well as a suitably dimensioned resistor and capacitor precharging contactor. Consult Schneider Electric for information about specifying these components.

The "direct power supply via DC bus" function can be used to control the precharging contactor via a relay or a logic input on the drive.

Example circuit using R2 relay:

Code	Name/Description	Adjustment range	Factory setting
dC0-	[DC BUS SUPPLY] This function is only accessible for ATV71LD48N4Z drives.		
dC0	<input type="checkbox"/> [Precharge cont. ass.] Logic output or control relay		[No] (nO)
nO	<input type="checkbox"/> [No] (nO): Function not assigned		
LO1	<input type="checkbox"/> [LO1] (LO1) to		
LO4	[LO4] (LO4): Logic output (if one or two I/O cards have been inserted, LO1 to LO2 or LO4 can be selected).		
r1	<input type="checkbox"/> [R1] (r1) to		
r4	[R4] (r4): Relay (selection of R1 extended to R3 or R4 if I/O card has been inserted).		
dO1	<input type="checkbox"/> [dO1] (dO1): Analog output AO1 functioning as a logic output. Selection can be made if [AO1 assignment] (AO1) page 198 = [No] (nO).		

[1.7 APPLICATION FUNCT.] (FUn-)

Top Z management

This function can be accessed only if a VW3 A3 411 card has been inserted and if [Encoder type] (EnS) = [AABB] (AAbb).

This function can be used for homing, but the leveling speed must be low, or the drive will trip in [Overbraking] (ObF).

Code	Name/Description	Adjustment range	Factory setting
↳ DP -	[TOP Z MANAGEMENT] This function can be accessed only if a VW3 A3 411 card has been inserted and if [Encoder type] (EnS) = [AABB] (AAbb).		
↳ DS E	<input type="checkbox"/> [Stop on top Z]		[No] (nO)
nO L I I - -	<p> Note: This function cannot be used with certain other functions. Follow the instructions on page 217.</p> <ul style="list-style-type: none"> <input type="checkbox"/> [No] (nO): Not assigned <input type="checkbox"/> [LI1] (LI1) ⋮ <input type="checkbox"/> [...] (...): See the assignment conditions on page 211. <p>The fast stop is activated when the input changes to 1 or the bit changes to 1 and after the detection of the next Top Z. If the input returns to state 0 and the run command is still active, the motor will only restart if [2/3 wire control] (tCC) page 174 = [2 wire] (2C) and the [2 wire type] (tCt) = [Level] (LEL) or [Fwd priority] (PFO). If not, a new run command must be sent.</p>

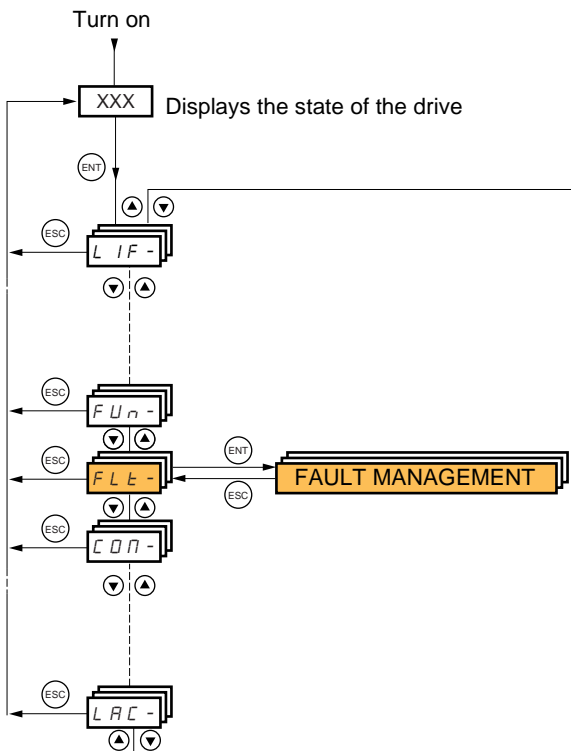

[1.8 FAULT MANAGEMENT] (FLt-)

The parameters in the [1.8 FAULT MANAGEMENT] (FLt-) menu can only be modified when the drive is stopped and there is no run command, except for parameters with a  symbol in the code column, which can be modified with the drive running or stopped.

PTC probes

3 sets of PTC probes can be managed by the drive in order to help to protect the motors:

- 1 on logic input LI6 converted for this use by switch "SW2" on the control card.
- 1 on each of the 2 option cards VW3A3201 and VW3A3202.

Each of these sets of PTC probes is monitored for the following detected faults:

- Motor overheating.
- Sensor break.
- Sensor short-circuit.

Protection via PTC probes does not disable protection via I^2t calculation performed by the drive (the two types of protection can be combined).

<p>If the restart has not taken place once the configurable time tAr has elapsed, the procedure is aborted and the drive remains locked until it is turned off and then on again. The detected faults, which permit this function, are listed on page 322:</p>			

Motor thermal protection

Function:

Thermal protection by calculating the I^2t .

 **Note:** The memory of the motor thermal state is saved when the drive is switched off. The power-off time is used to recalculate the thermal state the next time the drive is turned on.

- Naturally-cooled motors:
The tripping curves depend on the motor frequency.
- Force-cooled motors:
Only the 50 Hz tripping curve needs to be considered, regardless of the motor frequency.

Trip time in seconds

CAUTION

RISK OF DAMAGE TO THE DRIVE

Inhibiting faults results in the drive not being protected. This invalidates the warranty. Check that the possible consequences do not present any risk.
Failure to follow these instructions can result in equipment damage.

- [Freewheel] (YES)**: Freewheel stop
 - [Per STT] (Stt)**: Stop according to configuration of **[Type of stop] (Stt)** page 228, without tripping. In this case the fault relay does not open and the drive is ready to restart as soon as the detected fault disappears, according to the restart conditions of the active command channel (e.g. according to **[2/3 wire control] (tCC)** and **[2 wire type] (tCt)** page 174 if control is via the terminals). It is advisable to configure an alarm for this detected fault (assigned to a logic output, for example) in order to indicate the cause of the stop.
 - [fallback spd] (LFF)**: Change to fallback speed, maintained as long as the detected fault persists and the run command has not been removed (1).
 - [Spd maint.] (rLS)**: The drive maintains the speed being applied when the detected fault occurred, as long as the detected fault is present and the run command has not been removed (1).
 - [Ramp stop] (rMP)**: Stop on ramp.
 - [Fast stop] (FSt)**: Fast stop
 - [DC injection] (dCI)**: DC injection stop. This type of stop cannot be used with certain other functions. See table on page 217.
- Note:** A trip will occur when the thermal state reaches 118% of the rated state and reactivation will occur when the state falls back below 90%.

() Parameter that can be modified during operation or when stopped.

(1) Because, in this case, the detected fault does not trigger a stop, it is required to assign a relay or logic output to its indication.

[1.8 FAULT MANAGEMENT] (FLt-)

Deferred stop on thermal alarm

This function is designed in particular for elevator applications. It helps to prevent the elevator stopping between two floors if the drive or motor overheats, by authorizing operation until the next stop. At the next stop, the drive is locked until the thermal state falls back to a value, which undershoots the set threshold by 20%. E.g. A trip threshold set at 80% enables reactivation at 60%. One thermal state threshold must be defined for the drive, and one thermal state threshold for the motor(s), which will trip the deferred stop.

(1) Because, in this case, the detected fault does not trigger a stop, it is required to assign a relay or logic output to its indication.

[1.8 FAULT MANAGEMENT] (FLt-)

Code	Name/Description	Adjustment range	Factory setting
Sdd -	[ENCODER FAULT] Can be accessed if the encoder option card has been inserted and the encoder is used for speed feedback (see page 151).		
Sdd <i>nO</i> YES	<input type="checkbox"/> [Load slip detection] <input type="checkbox"/> [No] (nO) : Detected fault not monitored. Only the alarm may be assigned to a logic output or a relay. <input type="checkbox"/> [Yes] (YES) : Detected fault monitored. [Load slip detection] (Sdd) is forced to [Yes] (YES) if [Motor control type] (Ctt) page 146 = [FVC] (FUC) or [Sync.CL] (FSY) . The trip is triggered by comparison with the ramp output and the speed feedback, and is only effective for speeds greater than 10% of the [Rated motor freq.] (FrS) , see page 152. In the event of a trip, the drive will switch to a freewheel stop, and if the brake logic control function has been configured, the brake command will be set to 0.		[No] (nO)
ECC <i>nO</i> YES	<input type="checkbox"/> [Encoder coupling] <input type="checkbox"/> [No] (nO) : Detected fault not monitored. <input type="checkbox"/> [Yes] (YES) : Detected fault monitored. If the brake logic control function has been configured, the factory setting changes to [Yes] (YES) . [Encoder coupling] (ECC) = [Yes] (YES) is only possible if [Load slip detection] (Sdd) = [Yes] (YES) and [Motor control type] (Ctt) page 146 = [FVC] (FUC) or [Sync.CL] (FSY) and [Brake assignment] (bLC) page 240 is not [No] (nO) . The fault monitored is the break in the mechanical coupling of the encoder. In the event of a trip, the drive will switch to a freewheel stop, and if the brake logic control function has been configured, the brake command will be set to 0.		[No] (nO)
Ect	<input type="checkbox"/> [Encoder check time] Encoder faults filtering time. This parameter can be accessed if [Encoder coupling] (ECC) = [Yes] (YES)	2 to 10 s	2 s
tId -	[TORQUE OR I LIM. DETECT]		
SSb <i>nO</i> YES SEt	<input type="checkbox"/> [Trq/I limit. stop] Behavior in the event of switching to torque or current limitation <input type="checkbox"/> [Ignore] (nO) : Detected fault ignored. <input type="checkbox"/> [Freewheel] (YES) : Freewheel stop <input type="checkbox"/> [Per STT] (Stt) : Stop according to configuration of [Type of stop] (Stt) page 228, without tripping. In this case the fault relay does not open and the drive is ready to restart as soon as the fault disappears, according to the restart conditions of the active command channel (e.g. according to [2/3 wire control] (tCC) and [2 wire type] (tCt) page 174 if control is via the terminals). It is advisable to configure an alarm for this cause (assigned to a logic output, for example) in order to indicate the cause of the stop. <input type="checkbox"/> [fallback spd] (LFF) : Change to fallback speed, maintained as long as the cause persists and the run command has not been removed (1). <input type="checkbox"/> [Spd maint.] (rLS) : The drive maintains the speed being applied when the trip occurred, as long as the fault is present and the run command has not been removed (1). <input type="checkbox"/> [Ramp stop] (rMP) : Stop on ramp. <input type="checkbox"/> [Fast stop] (FSt) : Fast stop <input type="checkbox"/> [DC injection] (dCI) : DC injection stop. This type of stop cannot be used with certain other functions. See table on page 217.		[Ignore] (nO)
SEt ()	<input type="checkbox"/> [Trq/I limit. time out] (If fault has been configured). Time delay for taking SSF "Limitation" fault into account.	0 to 9999 ms	1000 ms

() Parameter that can be modified during operation or when stopped.

(1) Because, in this case, the detected fault does not trigger a stop, it is required to assign a relay or logic output to its indication.

Use of the "Pulse input" to measure the speed of rotation of the motor

This function uses the "Pulse input" from the VW3A3202 extension card and can, therefore, only be used if this card has been inserted and if the "Pulse input" is not being used for another function.

Example of use

A notched disc driven by the motor and connected to a proximity sensor can be used to generate a frequency signal that is proportional to the speed of rotation of the motor.

When applied to the "Pulse input", this signal supports:

- Measurement and display of the motor speed: signal frequency = $1/T$. This frequency is displayed by means of the [\[Pulse in. work. freq.\] \(FqS\)](#) parameter, page [130](#) or [132](#).
- Overspeed detection (if the measured speed exceeds a preset threshold, the drive will trip).
- Brake failure detection, if brake logic control has been configured: If the speed does not drop sufficiently quickly following a command to engage the brake, the drive will tri. This function can be used to detect worn brake linings.
- Detection of a speed threshold that can be adjusted using [\[Pulse warning thd.\] \(FqL\)](#) page [144](#) and is assignable to a relay or logic output, see page [190](#).

[1.8 FAULT MANAGEMENT] (FLt-)

Code	Name/Description	Adjustment range	Factory setting

 Parameter that can be modified during operation or when stopped.

[1.8 FAULT MANAGEMENT] (FLt-)

Card pairing

Function can only be accessed in **[Expert]** mode.

This function is used to detect whenever a card has been replaced or the software has been modified in any way.

When a pairing password is entered, the parameters of the cards currently inserted are stored. On every subsequent power-up these parameters are verified and in the event of a discrepancy the drive in HCF trips mode. Before the drive can be restarted you must revert to the original situation or re-enter the pairing password.

The following parameters are verified:

- The type of card for: all cards.
- The software version for: the two control cards, the VW3A3202 extension card, the Controller Inside card and the communication cards.
- The serial number for: both control cards.

Code	Name/Description	Adjustment range	Factory setting
PPI-	[CARDS PAIRING]		
PPI	<input type="checkbox"/> [Pairing password] The [OFF] (OFF) value signifies that the card pairing function is inactive. The [ON] (On) value signifies that card pairing is active and that an access code must be entered in order to start the drive in the event of a card pairing detected fault. As soon as the code has been entered the drive is unlocked and the code changes to [ON] (On) . - The PPI code is an unlock code known only to Schneider Electric Product Support.	OFF to 9999	[OFF] (OFF)

Network fault	0
Application fault	0
Internal link fault 1	0
Internal link fault 2	0
Encoder Fault	0
Code	Quick

This screen indicates the number of communication interruptions, for example, with the option cards.
Number: from 0 to 65535

For [\[Encoder Fault\]](#), which is only visible if a VW3 A3 408, VW3 A3 409, VW3 A3 410 or VW3 A3 411 card has been inserted, the figure displayed is one of the fault codes summarized in the table on the next page.

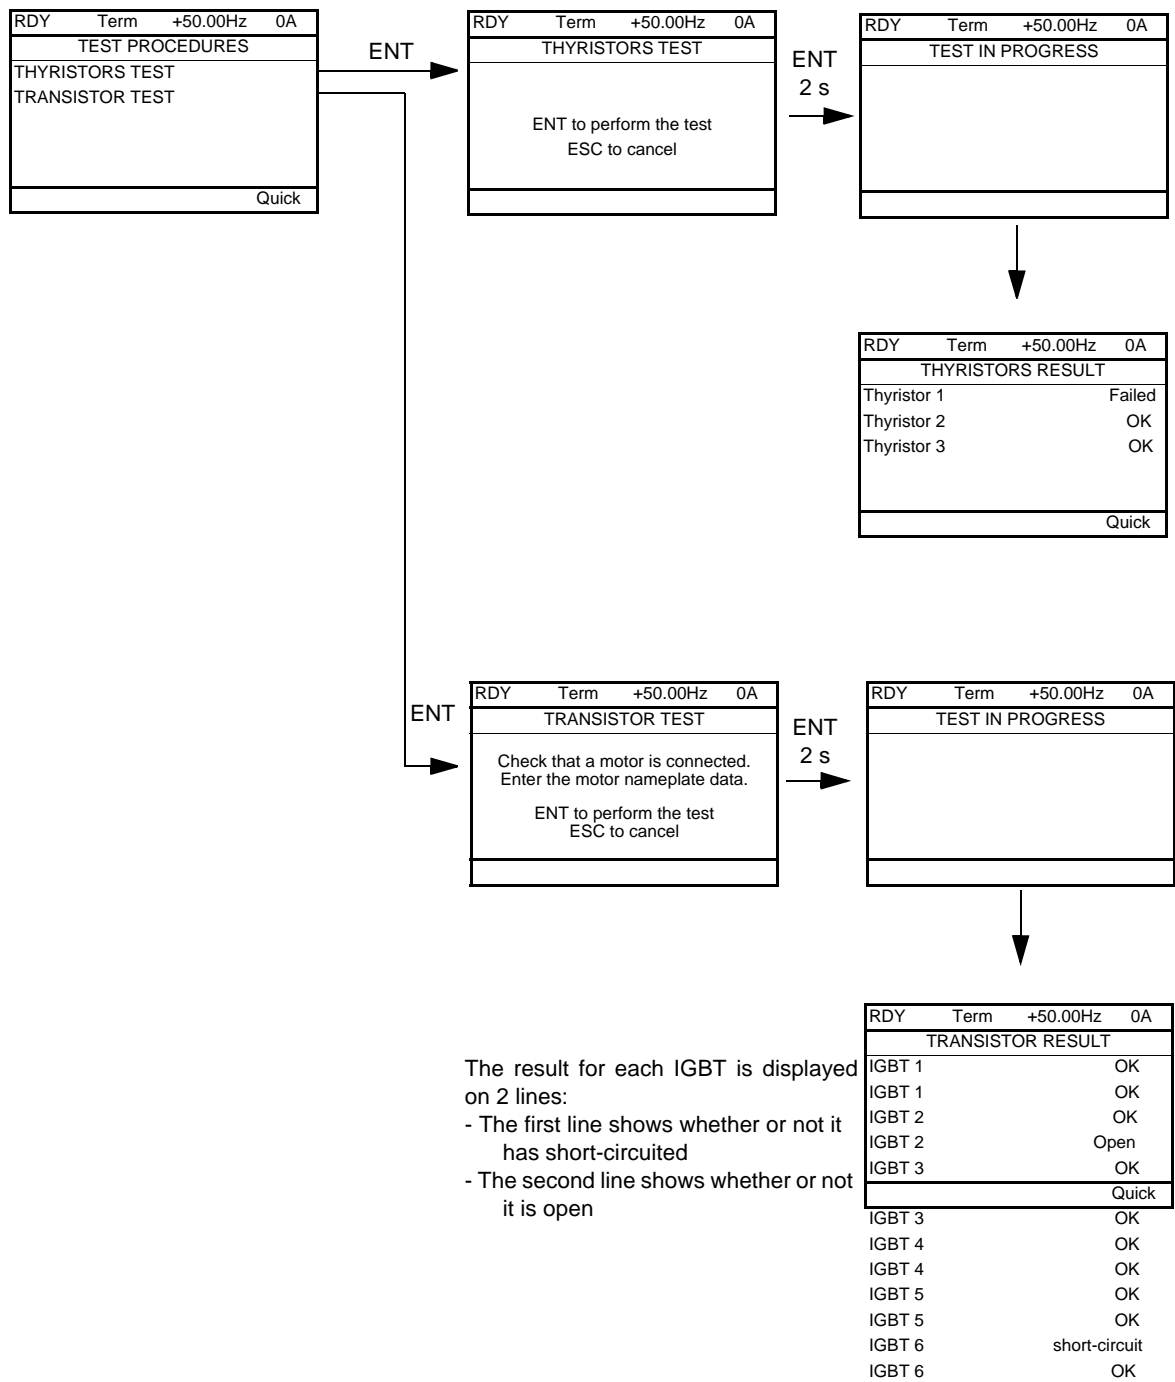

[1.10 DIAGNOSTICS]

Summary table of types of [Encoder Fault]

Code	Description of the error
0	No error, except if the control section has a separate power supply, in which case the power section must be turned on to display the actual code.
1	Internal UE/MC communication interruption (CRC error).
2	Internal UE/MC communication interruption (time out).
16	Synchronization error (PLL error).
17	Encoder signal cut or short-circuited.
18	PUC emulation detected fault.
19	Resolver: Unstable feedback signal.
20	Internal card communication interruption.
21	Resolver: Feedback signal too weak.
22	Resolver: Feedback signal too strong.
23	Encoder overcurrent.
32	EnDAT: CRC error.
33	EnDAT: Start bit not detected.
34	EnDAT: EEPROM access error.
35	EnDAT: Incorrect EEPROM value.
48	Hiperface: Incoherent SinCos signal.
49	Hiperface: Time out.
50	Hiperface: Unknown encoder.
51	Hiperface: CRC error.
64	SinCos: Incoherent SinCos signal.
80	SSI: Parity error.
81	SSI: Invalid data.
96	The position is not available.

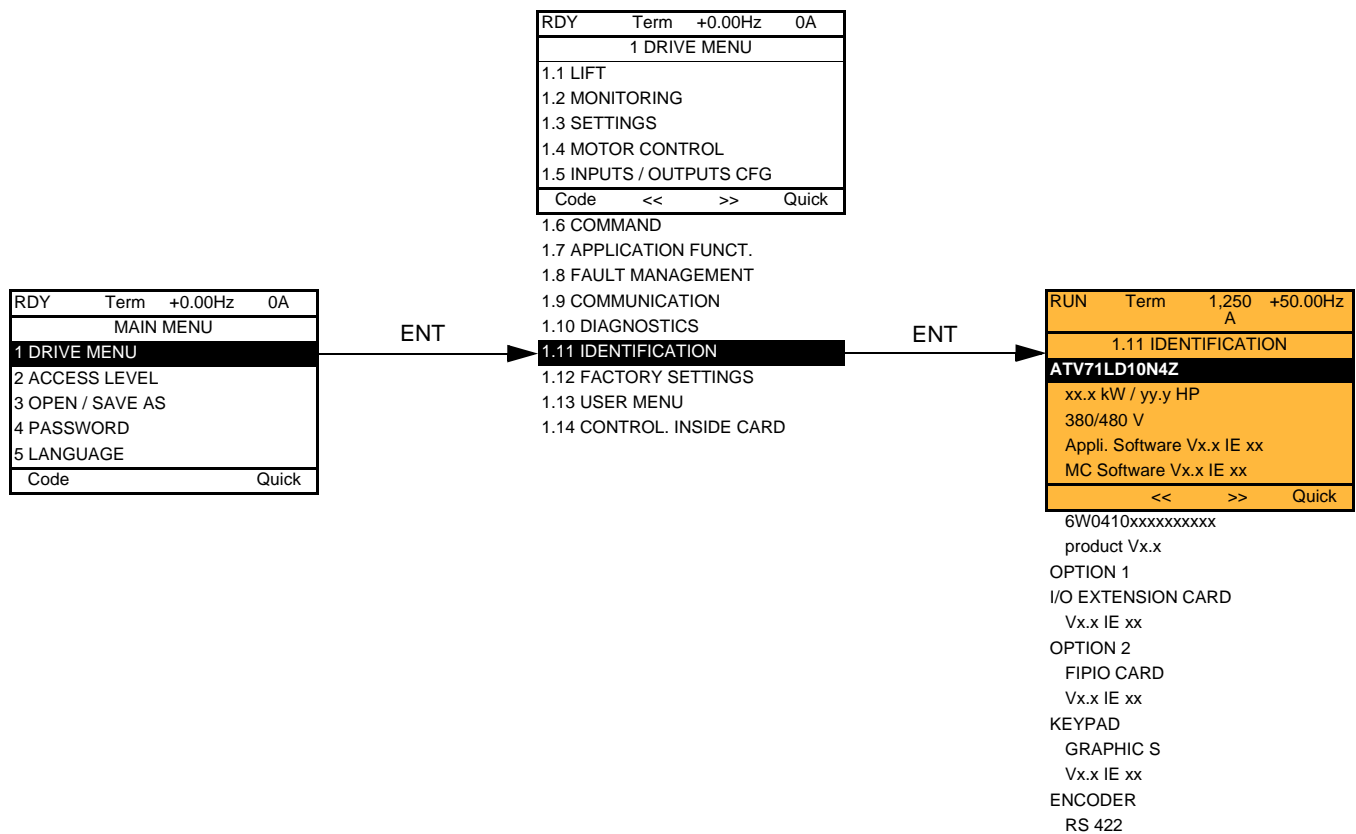

[1.10 DIAGNOSTICS]

[THYRISTORS TEST] is only accessible for ATV71LD48N4Z drives.

Note: To start the tests, press and hold down (2 s) the ENT key.

[1.11 IDENTIFICATION]

The [1.11 IDENTIFICATION] menu can only be accessed on the graphic display terminal.

This is a read-only menu that cannot be configured. It enables the following information to be displayed:

- Drive reference, power rating and voltage
- Drive software version
- Drive serial number
- Type of options present, with their software version.

[1.12 FACTORY SETTINGS] (FCS-)

With graphic display terminal:

With integrated display terminal:

The [1.12 FACTORY SETTINGS] (FCS-) menu is used to:

- Replace the current configuration with the factory configuration or a configuration saved previously. All or part of the current configuration can be replaced: Select a group of parameters in order to select the menus you wish to load with the selected source configuration.
- Save the current configuration to a file.

[4. PASSWORD] (COd-)

With graphic display terminal:

With integrated display terminal:

Enables the configuration to be protected with an access code or a password to be entered in order to access a protected configuration.

Example with graphic display terminal:

- The drive is unlocked when the PIN codes are set to **[unlocked] (OFF)** (no password) or when the correct code has been entered.
- Before protecting the configuration with an access code, you must:
 - Define the **[Upload rights] (ULr)** and **[Download rights] (dLr)**.
 - Make a careful note of the code and keep it in a place where you will always be able to find it.
- The drive has 2 access codes, enabling 2 access levels to be set up.
 - PIN code 1 is a public unlock code: 6969.
 - PIN code 2 is an unlock code known only to Schneider Electric Product Support. It can only be accessed in **[Expert]** mode.
 - Only one PIN1 or PIN2 code can be used - the other must remain set to **[OFF] (OFF)**.

Note: When the unlock code is entered, the user access code appears.

The following items are access-protected:

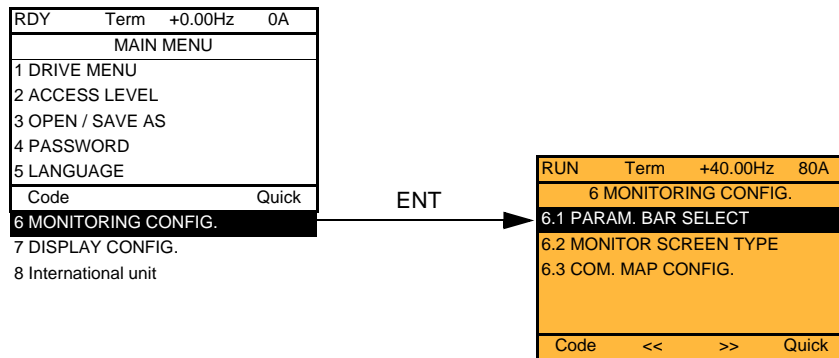

- Return to factory settings (**[1.12 FACTORY SETTINGS] (FCS-)** menu).
- The channels and parameters protected by the **[1.13 USER MENU]** as well as the menu itself.
- The custom display settings (**[7 DISPLAY CONFIG.]** menu).

[4. PASSWORD] (COd-)

Code	Name/Description	Adjustment range	Factory setting
<i>CSt</i> <i>LC</i> <i>ULC</i>	<input type="checkbox"/> [Status] Information parameter, cannot be modified. <input type="checkbox"/> [Locked] (LC) : The drive is locked by a password. <input type="checkbox"/> [Unlocked] (ULC) : The drive is not locked by a password.		[Unlocked] (ULC)
<i>COd</i>	<input type="checkbox"/> [PIN code 1] 1 st access code. The value [OFF] (OFF) indicates that no password has been set [Unlocked] . The value [ON] (On) indicates that the drive is protected and an access code must be entered in order to unlock it. Once the correct code has been entered, it remains on the display and the drive is unlocked until the next time the power supply is disconnected. - PIN code 1 is a public unlock code: 6969.	OFF to 9999	[OFF] (OFF)
<i>COd2</i>	<input type="checkbox"/> [PIN code 2] Parameter can only be accessed in [Expert] mode. 2 nd access code. The value [OFF] (OFF) indicates that no password has been set [Unlocked] . The value [ON] (On) indicates that the drive is protected and an access code must be entered in order to unlock it. Once the correct code has been entered, it remains on the display and the drive is unlocked until the next time the power supply is disconnected. - PIN code 2 is an unlock code known only to Schneider Electric Product Support.	OFF to 9999	[OFF] (OFF)
<i>ULr</i> <i>ULr0</i> <i>ULr1</i>	<input type="checkbox"/> [Upload rights] Read or copy the current configuration to the drive. <input type="checkbox"/> [Permitted] (ULr0) : The current drive configuration can always be uploaded to the graphic display terminal or PC-Software. <input type="checkbox"/> [Not allowed] (ULr1) : The current drive configuration can only be uploaded to the graphic display terminal or PC-Software if the drive is not protected by an access code or if the correct code has been entered.		[Permitted] (ULr0)
<i>dLr</i> <i>dLr0</i> <i>dLr1</i> <i>dLr2</i> <i>dLr3</i>	<input type="checkbox"/> [Download rights] Writes the current configuration to the drive or downloads a configuration to the drive <input type="checkbox"/> [Locked drv] (dLr0) : A configuration file can only be downloaded to the drive if the drive is protected by an access code, which is the same as the access code for the configuration to be downloaded. <input type="checkbox"/> [Unlock. drv] (dLr1) : A configuration file can be downloaded to the drive or a configuration in the drive can be modified if the drive is unlocked (access code entered) or is not protected by an access code. <input type="checkbox"/> [not allowed] (dLr2) : Download not authorized. <input type="checkbox"/> [Lock/unlock] (dLr3) : Combination of [Locked drv] (dLr0) and [Unlock. drv] (dLr1) .		[Unlock. drv] (dLr1)

[6 MONITORING CONFIG.]

This menu can only be accessed with the graphic display terminal.

This can be used to configure the information displayed on the graphic display screen during operation.

[6.1. PARAM. BAR SELECT]: Selection of 1 to 2 parameters displayed on the top line (the first 2 cannot be modified).

[6.2. MONITOR SCREEN TYPE]: Selection of parameters displayed in the centre of the screen and the display mode (digital values or bar graph format).

[6.3. COM. MAP CONFIG.]: Selection of the words displayed and their format.

[6 MONITORING CONFIG.]

Name/Description

[6.1 PARAM. BAR SELECT]

- [Alarm groups]
- [Frequency ref.] in Hz: parameter displayed in factory configuration.
- [Torque reference] as a %
- [Output frequency] in Hz
- [Motor current] in A: parameter displayed in factory configuration.
- [ENA avg speed] in Hz
- [Vitesse ascenseur] in m/s
- [Motor speed] in rpm
- [Motor voltage] in V
- [Motor power] in W
- [Motor torque] as a %
- [Mains voltage] in V
- [Travel distance]
- [Number of travels]
- [Motor thermal state] as a %
- [Drv. thermal state] as a %
- [DBR thermal state] in Wh or kWh depending on drive rating
- [Consumption] in hours (length of time the motor has been switched on)
- [Run time] in hours (length of time the drive has been switched on)
- [Power on time] in seconds (total time of IGBT overheating alarms)
- [IGBT alarm counter] Word generated by the Controller Inside card (can be accessed if the card has been inserted)
- [- - - - 02] Word generated by the Controller Inside card (can be accessed if the card has been inserted)
to CNFO, 1 or 2 (see page [261](#))
- [- - - - 06] SET1, 2 or 3 (see page [110](#))
- [Config. active]
- [Utilised param. set]

Select the parameter using ENT (a then appears next to the parameter). Parameter(s) can also be deselected using ENT. 1 or 2 parameters can be selected.

E.g.

[6 MONITORING CONFIG.]

Name/Description

[6.2. MONITOR SCREEN TYPE]

[Display value type]

- [Digital]: Display of one or two digital values on the screen (factory configuration).
- [Bar graph]: Display of one or two bar graphs on the screen.
- [List]: Display a list of between one and five values on the screen.

[PARAMETER SELECTION]

- [Alarm groups] can only be accessed if [Display value type] = [List]
- [Frequency ref.] in Hz: parameter displayed in factory configuration.
- [Torque reference] as a %
- [Output frequency] in Hz
- [Motor current] in A
- [ENA avg speed] in Hz
- [Vitesse ascenseur] in m/s
- [Motor speed] in rpm
- [Motor voltage] in V
- [Motor power] in W
- [Motor torque] as a %
- [Mains voltage] in V
- [Travel distance]
- [Number of travels]
- [Motor thermal state] as a %
- [Drv. thermal state] as a %
- [DBR thermal state] as a %
- [Consumption] in Wh or kWh depending on drive rating
- [Run time] in hours (length of time the motor has been switched on)
- [Power on time] in hours (length of time the drive has been switched on)
- [IGBT alarm counter] in seconds (total time of IGBT overheating alarms)
- [- - - - 02] Word generated by the Controller Inside card (can be accessed if the card has been inserted) to
- [- - - - 06] Word generated by the Controller Inside card (can be accessed if the card has been inserted)
- [Config. active] CNFO, 1 or 2 (see page 261), can only be accessed if [Display value type] = [List]
- [Utilised param. set] SET1, 2 or 3 (see page 110), can only be accessed if [Display value type] = [List]

Select the parameter(s) using ENT (a then appears next to the parameter). Parameter(s) can also be deselected using ENT.

[7 DISPLAY CONFIG.]

This menu can only be accessed with the graphic display terminal. It can be used to customize parameters or a menu and to access parameters.

7.1 USER PARAMETERS: Customization of 1 to 15 parameters.

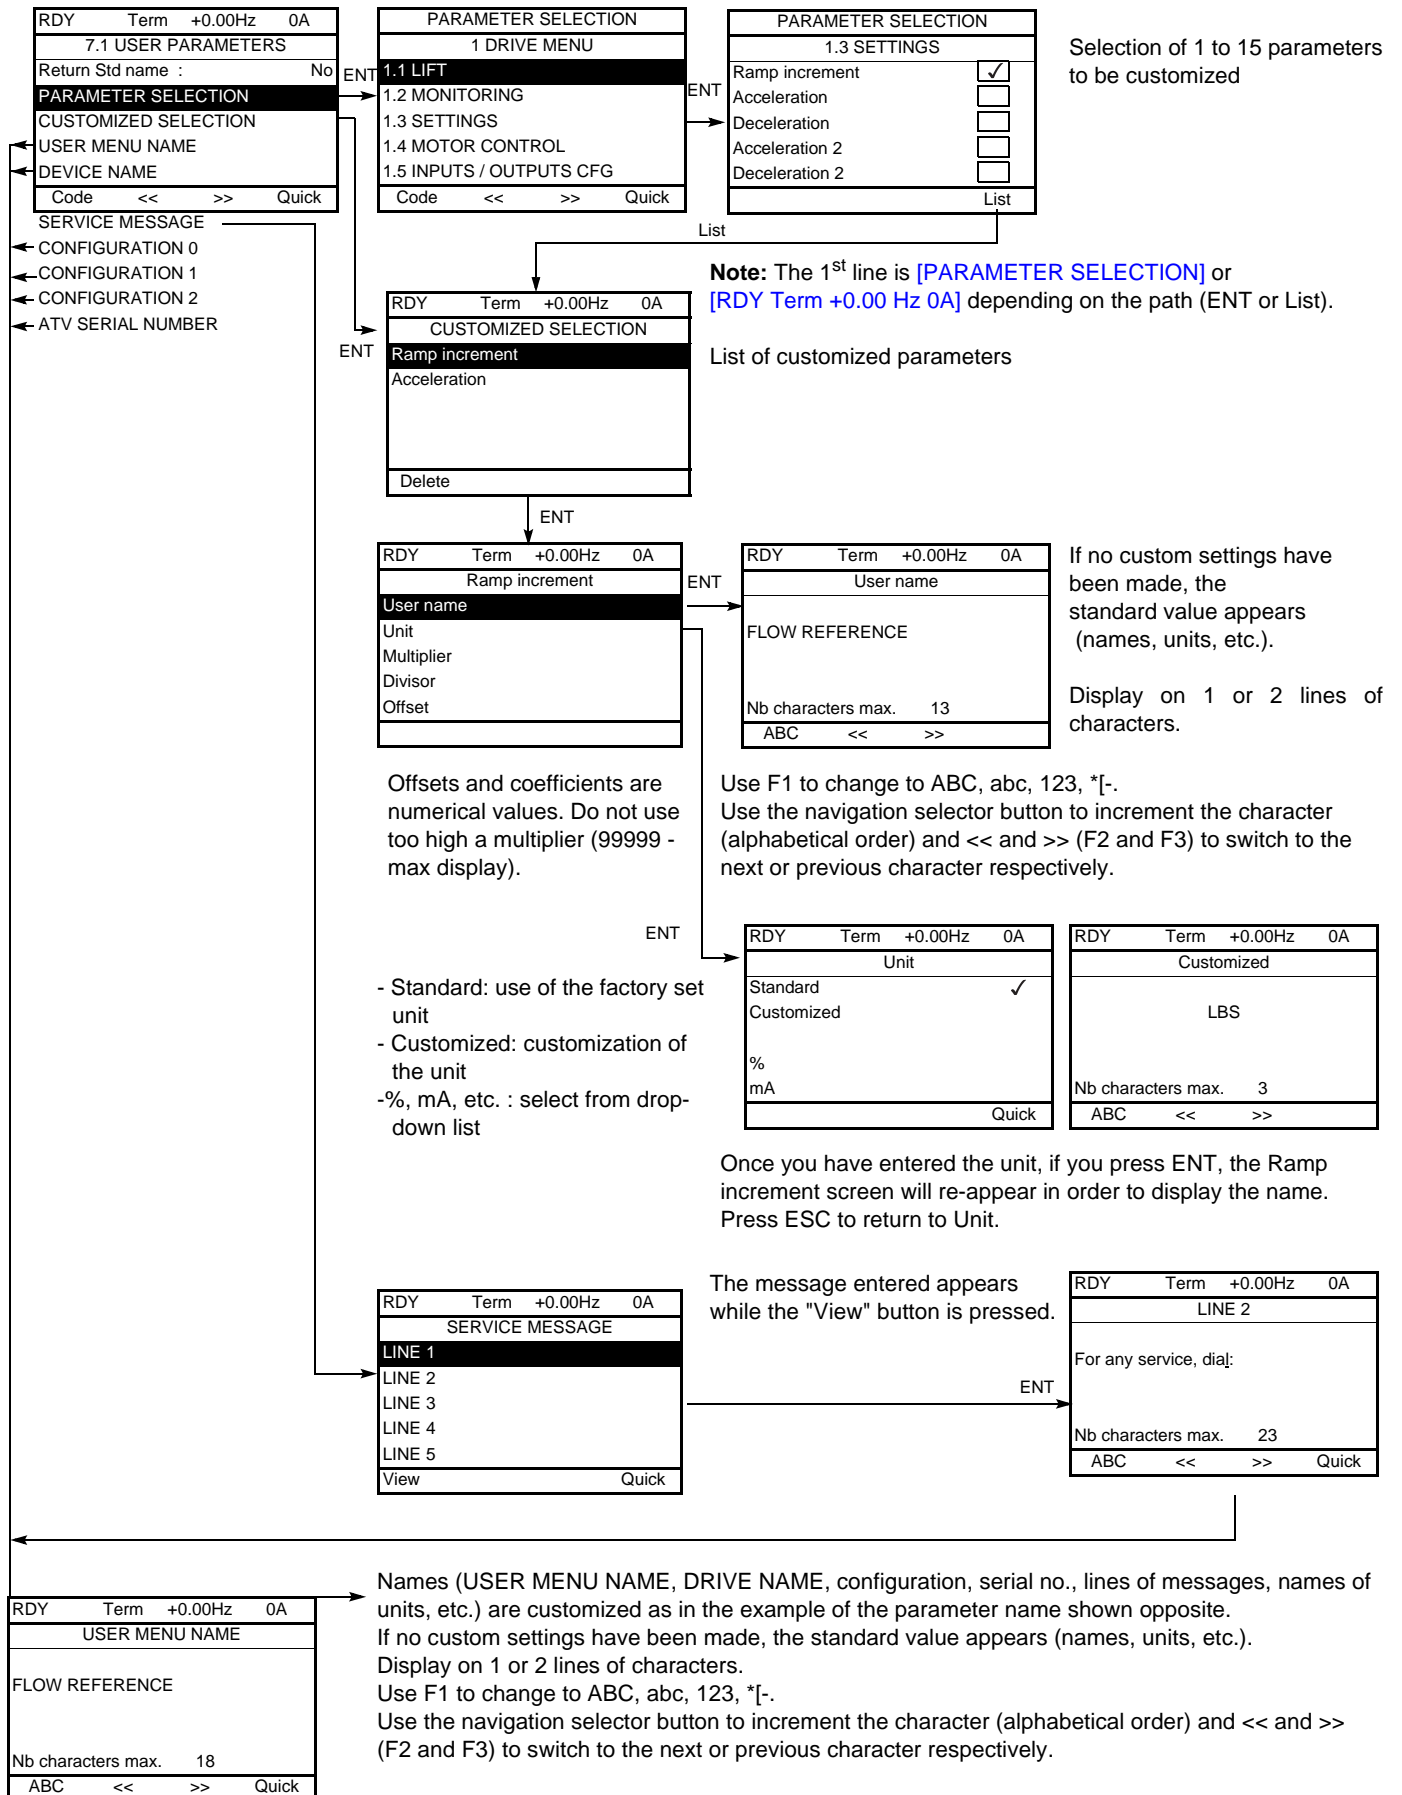

7.2 USER MENU: Creation of a customized menu.

7.3 PARAMETER ACCESS: Customization of the visibility and protection mechanisms of menus and parameters.

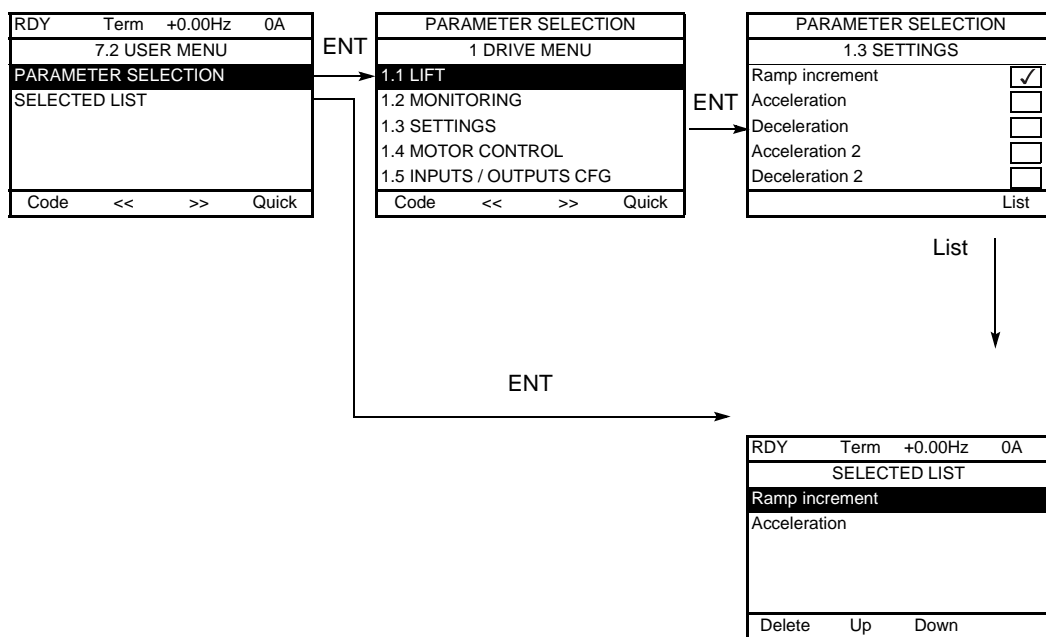

7.4 KEYPAD PARAMETERS: Adjustment of the contrast and stand-by mode of the graphic display terminal (parameters stored in the terminal rather than in the drive).

[7 DISPLAY CONFIG.]

If [Return Std name] = [Yes] the display reverts to standard but the custom settings remain stored.

[7 DISPLAY CONFIG.]

Selection of parameters included in the user menu.

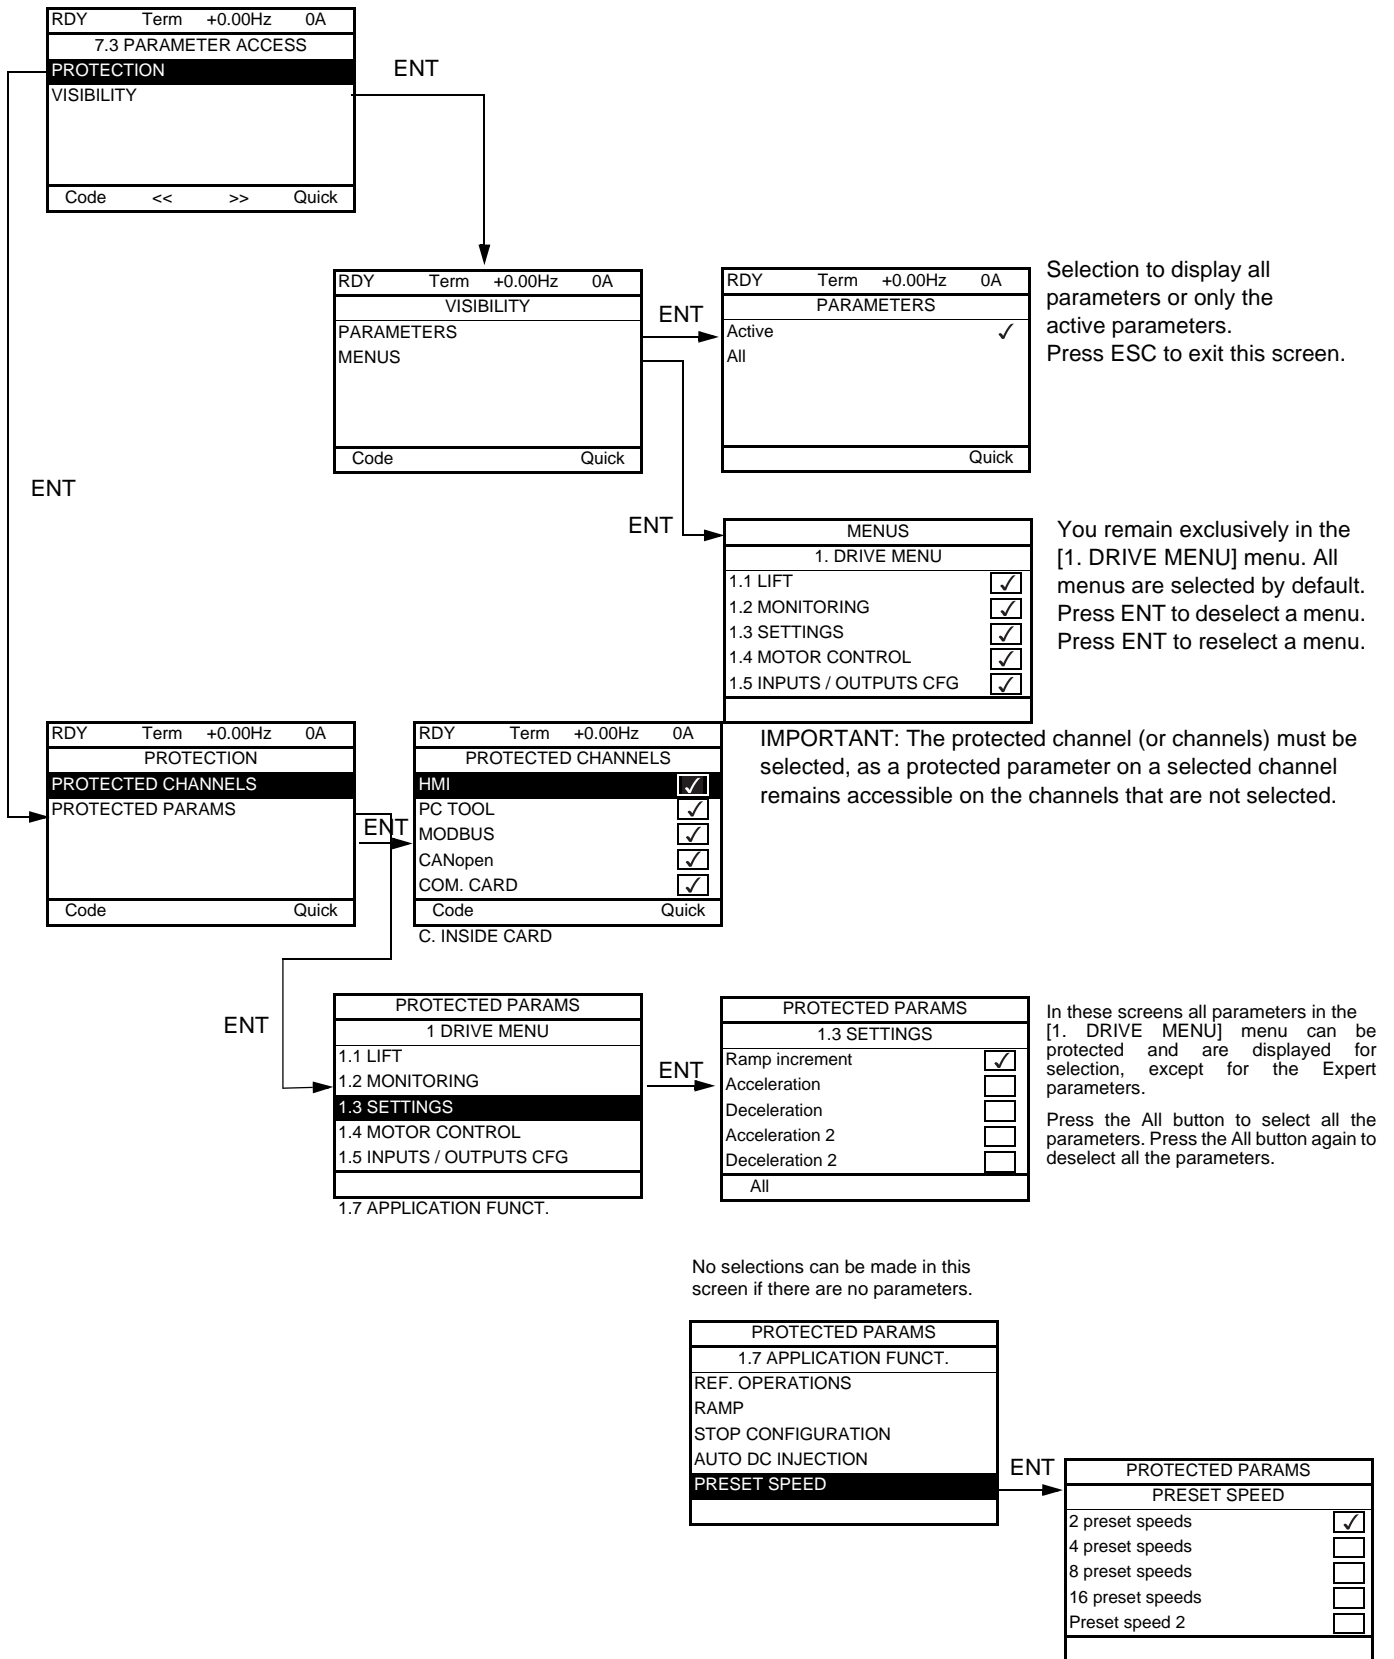

Note: The 1st line is [PARAMETER SELECTION] or [RDY Term +0.00 Hz 0A] depending on the path (ENT or List).

Parameter list making up the user menu.

Use the F2 and F3 keys to arrange the parameters in the list (example below using F3).

RDY	Term	+0.00Hz	0A
SELECTED LIST			
Acceleration			
Ramp increment			
Delete	Up	Down	

[7 DISPLAY CONFIG.]

Note: The protected parameters are no longer accessible and are not, therefore, displayed for the selected channels.

[7 DISPLAY CONFIG.]

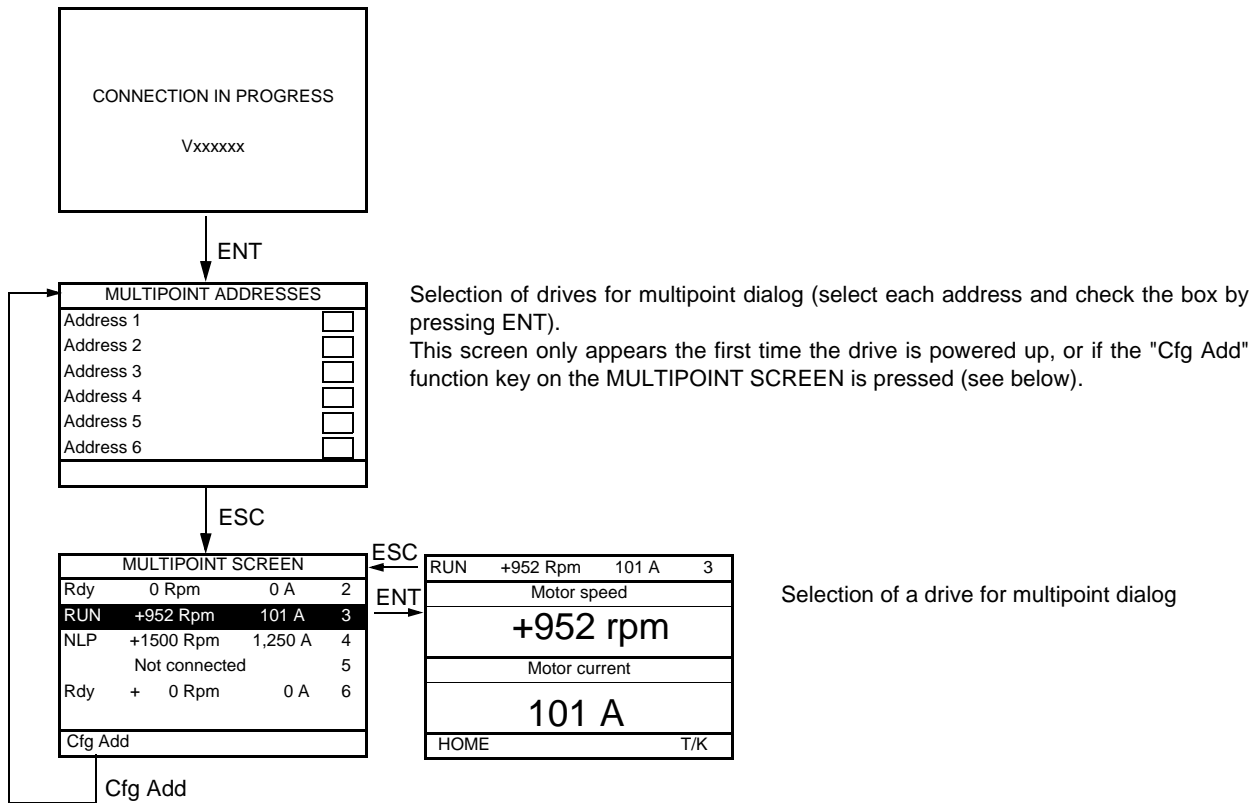

RDY	Term	+0.00Hz	0A
7.4 KEYPAD PARAMETERS			
Keypad contrast			
Keypad stand-by			
Code	<<	>>	Quick

Name/Description	Adjustment range	Factory setting
<input type="checkbox"/> [Keypad contrast] Adjustment of contrast on the graphic display unit.	0 to 100 %	50 %
<input type="checkbox"/> [Keypad stand-by] Configuration and adjustment of the graphic display unit's stand-by mode. <ul style="list-style-type: none"><input type="checkbox"/> [No]: No stand-by mode<input type="checkbox"/> [1] to [10]: Number of minutes during which the terminal is to remain idle before stand-by mode is triggered. After this idle time, the display backlight turns off and the contrast is reduced. The screen returns to normal operation when a key or the navigation button is pressed. It also returns to normal operation if the terminal exits the normal display mode, for example, if a trip occurs.		[5]

[MULTIPOINT SCREEN]

Communication is possible between a graphic display terminal and a number of drives connected on the same bus. The addresses of the drives must be configured in advance in the [\[1.9 COMMUNICATION\]](#) menu using the [\[Modbus Address\] \(Add\)](#) parameter, page [293](#).

When a number of drives are connected to the same display terminal, the terminal automatically displays the following screens:

Selection of drives for multipoint dialog (select each address and check the box by pressing ENT). This screen only appears the first time the drive is powered up, or if the "Cfg Add" function key on the MULTIPOINT SCREEN is pressed (see below).

Selection of a drive for multipoint dialog

In multipoint mode, the command channel is not displayed. From left to right, the state, then the 2 selected parameters and finally the drive address appear.

All menus can be accessed in multipoint mode. Only drive control via the graphic display terminal is not authorized, apart from the Stop key, which locks all the drives. If there is a trip on a drive, this drive is displayed.

Servicing

<i>Notice</i>	
RISK OF DAMAGE TO THE DRIVE	
Adapt the following recommendations according to the environment conditions: temperature, chemical, dust.	
Failure to follow these instructions can result in equipment damage.	

It is recommended to do the following in order to optimize continuity of operation.

Environment	Part concerned	Action	Periodicity
Knock on the product	Housing - control block (led - display)	Check the drive visual aspect	At least each year
Corrosion	Terminals - connector - screws - EMC plate	Inspect and clean if required	
Dust	Terminals - fans - blowholes		
Temperature	Around the product	Check and correct if required	
Cooling	Fan	Check the fan operation	After 3 to 5 years, depending on the operating conditions
		Replace the fan	
Vibration	Terminal connections	Check tightening at recom- mended torque	At least each year

- **Note:** The fan operation depends on the drive thermal state. The drive may be running and the fan not.

Assistance with maintenance, detected fault display

If a trip arises during setup or operation, first check that the recommendations relating to the environment, mounting and connections have been observed.

The first fault detected is saved and displayed, and the drive locks.

The trip can be indicated remotely via a logic output or a relay, which can be configured in the

[\[1.5 INPUTS / OUTPUTS CFG\] \(I-O-\)](#) menu, see, for example, [\[R1 CONFIGURATION\] \(r1-\)](#) page [190](#).

Menu [\[1.10 DIAGNOSTICS\]](#)

This menu can only be accessed with the graphic display terminal. It displays detected faults and their cause in plain text and can be used to carry out tests, see page [295](#).

Clearing the detected fault

In the event of a non resettable detected fault:

- Disconnect all power, including external control power that may be present.
- Lock all power disconnects in the open position.
- Wait 15 minutes to allow the DC bus capacitors to discharge (the drive LEDs are not indicators of the absence of DC bus voltage).
- Measure the voltage of the DC bus between the PA/+ and PC/- terminals to ensure that the voltage is less than 42 Vdc.
- If the DC bus capacitors do not discharge completely, contact your local Schneider Electric representative.
- Do not repair or operate the drive.
- Find and correct the detected fault.
- Restore power to the drive to confirm the detected fault has been rectified.

In the event of a resettable detected fault, the drive can be reset after the cause is cleared:

- By switching off the drive until the display disappears completely, then switching on again.
- Automatically in the scenarios described for the [\[AUTOMATIC RESTART\] \(Atr-\)](#) function, page [273](#).
- By means of a logic input or control bit assigned to the [\[FAULT RESET\] \(rSt-\)](#) function, page [272](#).
- By pressing the STOP/RESET key on the graphic display keypad if the active channel command is the HMI (see [\[Cmd channel 1\] \(Cd1\)](#) page [213](#)).

Menu [\[1.2 MONITORING\] \(SUP-\)](#):

This is used to prevent and find the causes of trips by displaying the drive state and its current values. It can be accessed with the integrated display terminal.

Spares and repairs:

Consult Schneider Electric product support.

Diagnostics and Troubleshooting

Drive does not start, no fault displayed

- If the display does not light up, check the power supply to the drive.
- The assignment of the Fast stop or Freewheel functions will help to prevent the drive starting if the corresponding logic inputs are not powered up. The ATVLIFT then displays [Freewheel] (nSt) in freewheel stop and [Fast stop] (FSt) in fast stop. This is normal since these functions are active at zero so that the drive will be stopped if there is a wire break.
- Check that the run command input is activated in accordance with the selected control mode ([2/3 wire control] (tCC) and [2 wire type] (tCt) parameters, page page 174).
- If an input is assigned to the limit switch function and this input is at zero, the drive can only be started up by sending a command for the opposite direction (see page 98)
- If the reference channel or command channel is assigned to a communication bus, when the power supply is connected, the drive will display [Freewheel] (nSt) and remain in stop mode until the communication bus sends a command.
- When an encoder is used with a VW3 A3 409 card, if the encoder is not fully configured, the drive remains locked in stop mode (displays [NST] (nSt) or [NLP] (nLP)).

Fault detection codes which require a power reset after the detected fault is cleared

The cause of the detected fault must be removed before resetting by turning off and then back on.

AnF, ASF, brF, ECF, EnF, SOF, SPF and tnF detected faults can also be cleared remotely by means of a logic input control bit ([Fault reset] (rSF) parameter, page 272).

Code	Name	Probable cause	Remedy
A I 2 F	[AI2 input]	<ul style="list-style-type: none"> • Non-conforming signal on analog input AI2 	<ul style="list-style-type: none"> • Check the wiring of analog input AI2 and the value of the signal.

Use a three-phase line supply. Disable the detected fault by setting [Input phase loss] (IPL) = [No] (nO). (page 276).
USF	[Undervoltage]	<ul style="list-style-type: none"> Line supply is too low Transient voltage dip 	<ul style="list-style-type: none"> Check the voltage and the parameters of [UNDERVOLTAGE MGT] (USb-), page 280.

Option card changed or removed

When an option card is removed or replaced by another, the drive locks in [Incorrect config.] (CFF) fault mode on power-up. If the card has been deliberately changed or removed, the detected fault can be cleared by pressing the ENT key twice, which **causes the factory settings to be restored** (see page 301) for the parameter groups affected by the card. These are as follows:

Card replaced by a card of the same type

- I/O cards: [Drive configuration] (drV)
- Encoder cards: [Drive configuration] (drV)
- Communication cards: Only the parameters that are specific to communication cards
- Controller Inside cards: [Control Inside menu] (PLC)

Card removed (or replaced by a different type of card)

- I/O card: [Drive configuration] (drV)
- Encoder card: [Drive configuration] (drV)
- Communication card: [Drive configuration] (drV) and parameters specific to communication cards
- Controller Inside card: [Drive configuration] (drV) and [Control. insid. menu] (PLC)

Control card changed

When a control card is replaced by a control card configured on a drive with a different rating, the drive locks in [Power Ident] (PrTF) fault mode on power-up. If the card has been deliberately changed, the detected fault can be cleared by selecting the good power rating manually.
